RE: Legacy NAA Apartments
Grading and Drainage Plan & Report
Engineer's Stamp Date 9-15-2016 (File: C18D064B)

Dear Mr. Soule:

Based upon the information provided in your submittal received 9-19-2016, the above-referenced plan is approved for Preliminary Plat Approval (#1009881). It is approved for ESC Building Permit (and ESC Grading Permit) with the following conditions:

1. Ensure that the Contractor receives the modified grate detail (Std Drawing #2220) to use on this project.
2. Ensure that the Contractor receives a legible version of the detail sheet.
3. The placement of the inline drains which was referenced in our previous review letter will be reviewed at CO.

Please attach a copy of this approved plan in the construction sets when submitting for a building permit. Prior to Certificate of Occupancy release, Engineer Certification per the DPM checklist will be required.

If you have any questions, you can contact me at 924-3986.

Sincerely,

Abiel Carrillo, P.E.
Principal Engineer, Planning Dept.
Development Review Services

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 12.41 acre multi family project located on Alameda Boulevard between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map35013C0137H, the majority of the entire site is located within Flood Zone X, a recent LOMR was approved removing a previous flood zone AE-1 foot. The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The development of the site will require the site to discharge at a rate equal to or less than the fully developed conditions assumed for this site in the governing North Albuquerque Acres Master Drainage Plan (NAAMDP), which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

VICINITY MAP: C-18-Z

FIRM MAP: 35001C0137H

LEGAL DESCRIPTION:

Corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates Subdivision. The upland properties have been designed to drain to the storm drain provided within Oakland and Alameda. The recently constructed San Pedro and Alameda storm drain were designed to convey the developed flow from this site. Excerpts of these plan are located in appendix A

PROPOSED CONDITIONS

The proposed improvements consist of a new multi family apartment complex with associated open space and paved parking areas. The drainage is conveyed to three separate discharge point. The site grading was designed utilizing a several onsite water quality ponds that fill and then 'spill' into either the onsite storm drain or into the parking lot. An onsite drainage basin map is located in appendix B. The basins have been color coded to better differentiate them. A spreadsheet calculating the hydrology is located in appendix B. An onsite storm drain map with drainage labels is also located within appendix B. The slopes for each reach have been labeled and the capacities for the pipes are confirmed in appendix C. The site generates flow that exceeds the allowable discharge rates specified within the NAA master drainage plan. To reduce the peak flow to less than allowable several of the ponds have been sized to retain the entire 100-year, 10-day volume generated, therefore removing that basin from contributing flow. The remaining peak exceedence is reduced by the introduction of orifice plates in the two western most inlets. The parking lots have been designed to act as detention basins. The stage storage calculation is located within appendix D. The detention basin was modeled utilizing AHYMO. As shown from the model in appendix D the detention basins reduce the developed site discharge to less than allowed.

As shown on the storm drain map, and site hydrology calculations, the allowable discharge to Oakland upstream of the diversion to eagle rock is 12.23 cfs. We propose to discharge 9.83 cfs. The allowable discharge to Oakland below the diversion, which drains to the san Pedro storm drain, is allowed to be 12.23 cfs. Out site will discharge 13.44 cfs, while this is 1.11 cfs higher than allowed, it enters into the san Pedro storm drain at lower down stream point that anticipated. The allowable discharge to Alameda is 24.46. This site will discharge 23.27 cfs, which is less than allowed. The discharge rates include the roadway frontage captured by the new inlets. The combined discharge to alameda and Oakland that contribute to the san Pedro storm drain is less than allowed. The existing double D inlets on Alameda are removed and replaced with double A inlets. .

The site is required to retain on site 9,413 cubic feet of water for the first flush. This site will retain onsite 15,562 cubic feet of water, which is 6149 cubic feet greater.

SUMMARY AND RECOMMENDATIONS

This project is a development of a multi family complex with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion. Our discharge will enter the downstream storm drain where it was generally anticipated. The inlets, pipes and roadways have been shown to provide the required capacity. The onsite flows are reduced to allowable by ponding certain areas and throttling the flow by creating a parking lot detention pond utilizing orifice plate to govern the discharge. The site has been designed in accordance with City of Albuquerque Drainage ordinance. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity.

DONALD S. WON
NEW MEXICO

- Commercial/Industrial (C/I): The area west of Louisiana Boulevard, north of Modesto Avenue and east of I-25 would develop as high density commercial and industrial. Also used for Paseo del Norte Corridor.
- Medium Density Industrial (MI): Campus type commercial/office facilities and APS schools sites.
- Sandia Tribal Lands (ST): Sandia tribal lands south of Tramway Road and north of the Sandia Pueblo Grant Boundary were allocated land treatments consistent with moderate levels of development even though there are no current plans to develop this area.

The relative weight of each type of Land Treatment is shown in Table 2.

Sounds good, then the information provided in the Revised Version of the plan dated 4/8/2016, received by email 5/9/2016 is approved for Site Plan for Building Permit, with the understanding that the Building Permit approval will require a future re-submittal to address comments provided for that approval request.

Thanks,

Thanks, I know we are trying to get this one through, can I get your concurrence that the next iteration of the report will show how those inlets comply with the Alameda/Oakland masterplans, and that if in reviewing the report we need to change them again that your owner/architect is ok with coming back and amending the infrastructure list?

Abiel, please find the attached revised infrastructure list and site plan package, We have added additional inlets to the existing stubs and provided RCP to all the inlets in the right of way. We are having weekly design meeting with the architect so some of the grading will be slightly adjusted and we will submit the report in accordance with your additional comments below. Thank you very much

David,

So, per this morning, out of the list below (for Prelim Plat/SPBP) I struck the comments that have been addressed

Subject: C18D064B - Legacy NAA Apartments - Stamp Date 3/25/2016

Mr. Soule,

This email is being sent in lieu of an attached comment letter in order to expedite the response for initial reviews. Responses to comments should continue to be included in the re-submittal. A reply to this email with responses to comments will not be considered a re-submittal.

Based on the information provided in your submittal received 3-24-2016, the above-referenced Grading and Drainage Report and Grading Plan cannot be approved for Preliminary Plat, Site Development for Building Permit, or Grading Permit. The plan can be approved for Site Plan for Subdivision, however, since it only involves the consolidation of the lots. The following sets of comments would need to be addressed prior to the applicable approval:

Preliminary Plat and Site Plan for Building Permit (DRB #1009881):

1. The Report (or a supplement) needs to show how the inlet types and sizes were selected along Alameda and Oakland. The Infrastructure List (which is tied to the SPBP) needs to reflect the sizes and types as well, since the work order involves removing and replacing inlets, and only installing a portion of the trunk along the frontage. Please find revised Infrastructure list showing the double C and single A inlet at each existing stub. ok

2. ~~The Drainage Plan should not rely on the proposed restriction of discharge to the adjacent property, even if it is currently owned by the same entity, and even though the overage is small. This is possible, but it appears to be much more feasible to reduce the peak discharge of this project below the allowable rate per the latest NAA Drainage Master Plan.~~

3. All pipes in the City Right of Way need to be either RCP or HPPP, the connection into the Oakland Ave Right of Way shows a 12" HDPE extension into the inlet. The attached plan has the corrected rcp within the right of way ok

4. ~~Show the diameter of all new and existing manholes (that are to be tied to) on Oakland and Alameda on the Plan.~~

PROVIDE IN A FUTURE SUBMITTAL :

Grading (ESC) Permit:

1. An Erosion and Sediment Control Plan needs to be approved by the City's Stormwater Quality Engineer.

2. Provide a Benchmark for the project.

3. There appears to be a disconnect between the information in the Grading Plan and the analysis completed in the Report.

4. Describe the check dams that are called out (dimensions, etc), or show a detail on the plan.

5. Show the modified grate detail (DWG #2220) on the plan since it is not published yet.

6. In general, the pipe layout consists of 12" diameter pipes; it is not clear that the interior inlets need to be 30" and/or Double D grated. up to them.

7. Provide a cross-section for the typical installation of the inline drains near the top of the first flush ponding areas. The typical detail provided is a general layout from the product catalog.

8. Clarify the distribution of discharge to the three outlet points by labeling the discharges on the Basin Map to facilitate future research of this project. Provide a full size Basin Map as a part of the Grading Plan. Provided

9. Consider using drop manholes just before the outlets instead of laying the entire interior pipe network so deep (8'+). It may be difficult for the Owner to maintain deep, 12" lines that have Tee connections. recommendation

10. If the project will be phased, provide a phasing plan. Not phased

11. Minor comments: address typos on the plan labels, label the street names on the exhibits; improve the quality of Sheet C3, the HGL exhibits in the report, and provide the full page of the city projects included. Most of these are not legible or difficult to relate to the Report/Plan.

Any question just let me know.

Will check the rest of the comments for CO..

LANDSCAPE NOTES:
Landscape maintenance shall be the responsibility of the Property Owner. The Property Owner shall maintain street trees and shrubs in a living, healthy, and attractive condition.

Water management is the sole responsibility of the Property Owner. All landscaping will be in conformance with the City of Albuquerque Zoning Code. In general, water conservative, environmentally sound landscape principles will be followed in design and installation.

Gravel over Filter Fabric to a minimum depth of 3" shall be placed in all landscape areas.

IRRIGATION NOTES:
Irrigation system maintenance and operation shall be the sole responsibility of the owner. It shall be the owners responsibility to ensure that fugitive water does not leave the site due to overwatering.

Irrigation shall be a complete underground system with Trees to receive 1 Netafim spiral (50' length) with 3 loops at a final radius of 4.5' from tree trunk, pinned in place. Netafim shall have emitters 12" o.c. with a flow of .6 gph. Shrubs to receive (2) 1.0 GPH Drip Emitters. Drip and Bubbler systems to be tied to 1/2" polypipe with flush caps at each end.

Run time per each shrub drip valve will be approximately 15 minutes per day. Tree drip valve shall run 1.5 hours, 3 times per week. Run time will be adjusted according to the season.

Point of connection for irrigation system is unknown at current time and will be coordinated in the field. Irrigation will be operated by automatic controller.

Location of controller to be field determined and power source for controller to be provided by others.
Irrigation maintenance shall be the responsibility of the Property Owner.
Water and Power source shall be the responsibility of the Developer/Builder.

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

Subject: C18D064B - Legacy NAA Apartments - Stamp Date 3/25/2016

Mr. Soule, FLOODPLAIN AO (1' Depth)

This email is being sent in lieu of an attached comment letter in order to expedite the response for initial reviews. Responses to comments should continue to be included in the re-submittal. A reply to this email with responses to comments will not be considered a re-submittal.

Based on the information provided in your submittal received 3-~~24~~ 30-2016, the above-referenced Grading and Drainage Report and Grading Plan cannot be approved for Preliminary Plat, Site Development for Building Permit, or Grading Permit. The plan can be approved for Site Plan for Subdivision, however, since it only involves the consolidation of the lots. The following sets of comments would need to be addressed prior to the applicable approval:

Preliminary Plat and Site Plan for Building Permit (DRB #1009881):

1. The Report (or a supplement) needs to show how the inlet types and sizes were selected along Alameda and Oakland. The Infrastructure List (which is tied to the SPBP) needs to reflect the sizes and types as well, since the work order involves removing and replacing inlets, and only installing a portion of the trunk along the frontage.

✓ 2. The Drainage Plan should not rely on the proposed restriction of discharge to the adjacent property, even if it is currently owned by the same entity, and even though the overage is small. This is possible, but it appears to be much more feasible to reduce the peak discharge of this project below the allowable rate per the latest NAA Drainage Master Plan.

3. All pipes in the City Right of Way need to be either RCP or HPPP, the connection into the Oakland Ave Right of Way shows a 12" HDPE extension into the inlet.

✓ 4. Show the diameter of all new and existing manholes (that are to be tied to) on Oakland and Alameda on the Plan.

Grading (ESC) Permit:

1. An Erosion and Sediment Control Plan needs to be approved by the City's Stormwater Quality Engineer.

2. Provide a Benchmark for the project.

3. There appears to be a disconnect between the information in the Grading Plan and the analysis completed in the Report.

4. Describe the check dams that are called out (dimensions, etc), or show a detail on the plan.

5. Show the modified grate detail (DWG #2220) on the plan since it is not published yet.

6. In general, the pipe layout consists of 12" diameter pipes; it is not clear that the interior inlets need to be 30" and/or Double D grated.

7. Provide a cross-section for the typical installation of the inline drains near the top of the first flush ponding areas. The typical detail provided is a general layout from the product catalog.

8. Clarify the distribution of discharge to the three outlet points by labeling the discharges on the Basin Map to facilitate future research of this project. Provide a full size Basin Map as a part of the Grading Plan.

9. Consider using drop manholes just before the outlets instead of laying the entire interior pipe network so deep (8'+). It may be difficult for the Owner to maintain deep, 12" lines that have Tee connections.

10. If the project will be phased, provide a phasing plan.

11. Minor comments: address typos on the plan labels, label the street names on the exhibits; improve the quality of Sheet C3, the HGL exhibits in the report, and provide the full page of the city projects included. Most of these are not legible or difficult to relate to the Report/Plan.

Any question just let me know.

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 12.41 acre multi family project located on Alameda Boulevard between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map35013C0137H, the majority of the entire site is located within Flood Zone X, a recent LOMR was approved removing a previous flood zone AE-1 foot. The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The governing North Albuquerque Acres Master Drainage Plan (NAAMDP), provides flows for development of this area, which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

Exhibit A Vicinity Map

corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates Subdivision. The upland properties have been designed to drain to the storm drain provided within Oakland and Alameda. The recently constructed San Pedro and Alameda storm drain were designed to convey the developed flow from this site.

PROPOSED CONDITIONS

The proposed improvements consist of a new multi family apartment complex with associated open space and paved parking areas. The complex shall drain to 3 different public storm drain conduits for this site. Two of these conduits are in Oakland ave. and the third is in Alameda Blvd. The eastern most conduit is in the Oakland Diversion system, the western culvert is the Oakland system and the third is the Alameda system. All three of these systems outfall to the large storm drain in San Pedro blvd.

As shown in the drainage plan, the site will contain 22 onsite basins, with an additional basins affecting Oakland and Alameda. Basins D, F and G discharge into the Oakland Diversion system. Basins I-1,I-2,J-1,J-2,L,M-1 and M-2 discharge into the Oakland system. Basins E, H, K-1, K-2, N,O, P, Q and Q-1 discharge into the Alameda system.

Two new public storm drain culverts are to be constructed in Oakland. The eastern 30 inch rcp will discharge into the Oakland Diversion system and the western 30 inch rcp will discharge into the storm drain in San Pedro blvd.

The outfall hydraulic grade lines used for these the three systems from this site were taken from the city approved plans. The Oakland Diversion system hgl was taken from City project no. 7424.81, the Oakland system was taken from City project no. 5394.91 and the Alameda system was taken from City project no. 7663.91. (pertinent portions are included in the

appendix). The Oakland Diversion system discharges 9.54cfs into the public system, the Oakland system discharges 14.84cfs into the public system and the Oakland system discharges 23.46cfs into the public system.

The analysis for each of the three storm drainage system are included in this report. The site discharges approximately 3.50cfs more than the projected discharge in the NAAMDP, this does not include the anticipated reduction due to additional infiltration/abstraction from water quality ponds, however the site to the west of this project is owned by the same entity, thus their site will need to reduce their flow by an additional 3.50cfs to account for this increase in discharge. A letter to this effect will be provided by the owners. The site just to the west of this project drains in a westerly direction, about 2 acres of runoff discharges into the new catch basin at the northwest corner of this site. These 2 acres generate 3.45cfs/ac, thus about 7cfs flow into this catch basin.

How would this be transfered to another owner? If it was difficult to achieve in this one, why would it be feasible just to the west.

SUMMARY AND RECOMMENDATIONS

This project is a development of residential subdivision with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion with the exception of only 3.50cfs. Our discharge will enter the downstream storm drain where it was anticipated. The inlets, pipes and roadways have been shown to provide the required capacity. The capacity is not a factor with this development and reduced discharge will need to be designed on the later commercial phases of this property. The site has been designed in accordance with City of Albuquerque Drainage ordinance. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity.

Specifically ~~say~~ state the max discharge, not a relative value

- Commercial/Industrial (C/I): The area west of Louisiana Boulevard, north of Modesto Avenue and east of I-25 would develop as high density commercial and industrial. Also used for Paseo del Norte Corridor.
- Medium Density Industrial (MI): Campus type commercial/office facilities and APS schools sites.
- Sandia Tribal Lands (ST): Sandia tribal lands south of Tramway Road and north of the Sandia Pueblo Grant Boundary were allocated land treatments consistent with moderate levels of development even though there are no current plans to develop this area.

The relative weight of each type of Land Treatment is shown in Table 2.

OAKLAND REACH

Signal North to Alameda Blvd.: A 66-inch pipe will be installed between Signal and Alameda Blvd. At Alameda Blvd., a 54- and 60-inch collector system will be installed east of San Pedro to collect 252 CFS and convey it to the trunk line. The main system will increase to an 84-inch pipe at Alameda Blvd.

Alameda Blvd. to Oakland: An 84-inch pipe will be installed between Alameda Blvd. and Oakland and this pipe will convey 417 CFS.

Oakland to Eagle Rock: A 36-inch storm drain system will be stubbed out to the east in Oakland to collect 45 CFS from this street. The 36-inch pipe will connect to the 84-inch main line that will convey 462 CFS to the proposed junction box that will be located at the intersection of San Pedro and Eagle Rock.

Intersection of San Pedro and Eagle Rock: A junction box will be constructed at San Pedro and Eagle Rock. This box will receive the 462 CFS from south of Eagle Rock and an additional 256 CFS from Eagle Rock east of the intersection. The total flow to the junction box will be 718 CFS. This flow will be split at the junction box using a 72-inch pipe to the west and an 84-inch pipe to the north. The invert of the j-box will be set 4 feet lower than the in-coming storm drain inverts to produce a head in the j-box sufficient to move 325 CFS to the west and 393 CFS to the north. The out-going pipes are sized so that the flows will be metered in each direction. The outlet pipes were sized to operate as culverts that are subject to inlet control conditions and this condition is achieved by 1) sizing the outlet pipes; and 2) setting the slopes of the pipes such that the outlet pipes do not backwater into the junction box.

Eagle Rock West of San Pedro: The proposed 72-inch pipe will connect to the existing storm drain located in Eagle Rock about half way between San Pedro and the I-25 frontage roads. This system will convey 325 CFS to the existing culvert head box located at the I-25 frontage road just north of Eagle Rock. As-constructed drawings indicate that these culverts will convey the planned 325 CFS to the west side of I-25 through five (5) 305 foot long 36-inch RCP culverts.

Eagle Rock to Alameda Place: This system will start as an 84-inch pipe at the j-box to allow the required flows to move out of the j-box and will reduce to a 78-inch pipe approximately 32 feet north of the j-box by the use of a bulk head reducer. The 78-inch pipe will convey the 393 CFS from the j-box north to Alameda Place.

Alameda Place to the I-25 Frontage Road: The system will turn west from the intersection of San Pedro and Alameda Place and the size will be reduced to a 72-inch pipe in Alameda Place.. An additional 50 CFS will be intercepted by the system at Alameda Place. The 72-inch pipe will carry a combined flow of 442 CFS and will continue west to a pre-determined angle point, then will continue to a planned junction box at the I-25 frontage road. The angle point located in Alameda Place will be determined during the design and will depend on the availability of an easement through the business located on the north side of Alameda Place.

RE: **Eagle Crest Subdivision (File: C18D064B)**
Drainage Report (stamped 7-3-14) and Supplemental calcs(stamped 8-1-14)
Grading and Drainage Plan, Engineer's Stamp Date 8-1-14

Dear Mr. Soule:

Based upon the information provided in your submittal received 8-1-14, the above referenced submittal cannot be approved for action by the DRB on the Site Plan for Building Permit or the Preliminary Plat until the following comments are addressed:

1. Interim Ponds need to be sized and graded on grading plan with WSEL, Vol. and emergency overflow locations. Plats must show a public drainage easement to be maintained by the developer.
2. Inlets in Alameda: Per conversation with Dave Thompson, the intent was to put the D-inlets in for the interim only, but for full build out 2 or 3 double-A or double-C inlets in series were required at each lateral. Remove the D-inlets and have the correct number of Double A or C inlets in series based on hydraulics. Provide hydraulic calculations for these inlets, which most likely will require a definition of basin "ALA 1". Update infrastructure list with inlets
3. Tie Private Storm drain to Manhole rather than back of inlet. Is there a MH at east most inlet in Alameda?
4. Define the limits of offsite basin "Basin Upoak3" on a basin boundary map. How is upstream flows handled in Oakland? (Add to report)
5. Define limits of offsite basin "Remainingoak Basin" on a basin boundary map.
6. Use a Match line to continue the Alameda frontage plan.
7. Proposed retaining wall and screen wall are difficult to differentiate. Change the hatch pattern on one or the other.
8. Show spot elevations at retaining walls
9. Update the Unit basin calculation, mainly the narrative and water harvesting in the front yard.
10. Basin map –show limits of basin per phase with different line type or color or both. It looks like B1 and B2 were reduced.
11. Water harvesting ponds – show contour elevations. Appears that another contour is needed.
12. Show flow arrows, proposed contours, street slopes, and street names.

PO Box 1293
Albuquerque
New Mexico 87103
www.cabq.gov

13. Street capacity calculations: Show how the Q is determined. Identify on the Plan the standard curb and the mountable curb. For Soaring, upper 2/3, the depth is 4" but does not take into account the energy depth.
14. Drop inlet Calculation: Identify the drop inlet the calculation corresponds to. What about the other inlets in Oakland and in Alameda?
15. Pipe Capacity: What is HGL of Storm Drain pipes? Show calc for 30" pipe further down Oakland. Pipe 4 should be using hydrology from Alameda (the bypass flow further upstream and the remaining roadway basin further upstream) for the Q required.
16. Revise the drainage report to be consistent with any revisions in hydraulics or hydrology.

Since the disturbed area on this site exceeds 1.0 acre, an Erosion and Sediment Control (ESC) Plan, prepared by a NM PE and approved by the City's Stormwater Engineer, will be required for this site, prior to Hydrology approval of a Building Permit or Work Order.

If you have any questions, you can contact me at 924-3695.

Sincerely,

Rita Harmon, P.E.

RE: **Eagle Crest Subdivision**
Drainage Report and Grading and Drainage Plan
Engineer's Stamp Date 7-3-14 (File: C18D064B)

Dear Mr. Soule:

Based upon the information provided in your submittal received 7-3-14, the above referenced submittal cannot be approved for action by the DRB on the Site Plan for Building Permit or the Preliminary Plat; nor for Grading Permit until the following comments are addressed. Please note that the following comments are cursory, and a more detailed review will be performed after the initial comments are addressed.

1. Since the proposed subdivision is partially in a Special Flood Hazard Area (AO with 1 ft. depth) an application for a LOMR is in order. However, until such time that the LOMR is approved, the City cannot issue building permits within a flood zone. Therefore, in the interest of time, it may be beneficial to raise the finished pads above the Base Flood Elevation and apply for a LOMR-F. The finished pads would have to be 1' above the highest contour elevation that crosses the lot.
2. Since this project is to be phased, a scheme to handle drainage must be determined for all the interim conditions, and also the final condition.
3. Ponding used for the management of the "first flush" should be only on the front yard as backyards are often landscaped and modified substantially.

Since the disturbed area on this site exceeds 1.0 acre, an Erosion and Sediment Control (ESC) Plan, prepared by a NM PE and approved by the City's Stormwater Engineer, will be required for this site, prior to Hydrology approval of a Building Permit or Work Order.

If you have any questions, you can contact me at 924-3695.

RE: Grading and Drainage Plan
Eagle Crest (C18D064B)

Dear Ms. Harmon

The purpose of this letter is to accompany the enclosed grading plan and supplemental for the referenced project. This plan was revised to address your comments. A list of your comments dated 7/24/14 (letter attached). A description as to how we addressed are as follows

1. We have denoted the lots that will be affected and shown which ones will be able to obtain a LOMR-F and which ones will require LOMR prior to issuance of building permit. The LOMR has been started and based upon the previous LOMR upstream the approval should be very straight forward.
2. We have shown the phasing as required. Phase 1-3 will temporarily retain the flows generated from each phase.
3. We have better described the berm and pond concept to contain the first flush

We have enclosed the updated basin map and the hydraulic calculations for the phasing, the basins did not change.Should you have any questions regarding this re-submittal, please do not hesitate to call me.

Sincerely,

David Soule, PE

RE: **Eagle Crest Subdivision**
Drainage Report and Grading and Drainage Plan
Engineer's Stamp Date 8-19-2014 (File: C18D064B)

Dear Mr. Soule:

Since the DRB approved the Preliminary Plat and Site Plan for Subdivision on 8-20-2014, and based upon the information provided in your submittal received 8-19-14, the above referenced submittal is approved for Grading Permit. Upon completion of the project, provide an Engineer Certification for our files.

Please note that ~~since~~ the lateral pipes in Alameda are shown as 30"dia. RCP in more recent plans (as opposed to 24" RCP from earlier plans). Forthcoming as-builts should confirm this. Also, the storm drain from Soaring Avenue to Alameda (back of inlet) is sized as a 30" RCP in the report, and the DRC plans should reflect this.

If you have any questions, you can contact me at 924-3695.

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 60-lot subdivision located on Oakland Avenue between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map35013C0137H, the majority of the site is located within Flood Zone X; a portion of the site is impacted by flood zone AE-1 foot. The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The development of the site will require the site to discharge at a rate equal to or less than the fully developed conditions assumed for this site in the governing North Albuquerque Acres Master Drainage Plan (NAAMDP), which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates Subdivision. The upland properties have been designed to drain to the storm drain provided within Oakland. The recently constructed San Pedro and Alameda storm drain were designed to convey the developed flow from this site.

PROPOSED CONDITIONS

The proposed improvements consist of a new 60-lot subdivision serviced by public paved roadway. The lots shall free discharge to the roadway and be conveyed within the roadway to the available downstream storm drain. Each lot will be required to retain the first .34" of rain or 165 cubic feet per lot. The plan specifies the minimum dimensions of a front yard pond or an alternative underground catchment basin- stormtech SC740. A copy of the product sheet is located in appendix B. All the flow leaving the site will be conveyed via surface drainage to Oakland or underground storm drain to Alameda. The proposed land treatment will conform to the residential density assumptions of the NAADMP. The site discharge is reduced to these master plan assumptions by the creation of water quality ponds in front yards. The impervious area is consistent with table A.5 of the DPM, utilizing 4.8 dwelling units per acre.

As shown in appendix B, the site will contain 6 onsite basins, with an additional five basins affecting Oakland and 6 basins affecting Alameda. Basin A1 and A2 contain the northern half of the subdivision which corresponds to NAAMDP basin 117.2. These basins will generate 19.96 cfs. or 9.98 cfs per basin. This flow will be conveyed within the roadways double grated type A inlets. As shown in appendix B, each inlet grate has the capacity for 12 cfs or 24cfs per inlet. Basin A1 drains to a new inlet to be constructed within Oakland. This storm drain reach will be connected to the existing eagle rock diversion to the existing 24" storm drain at the west end of

our site. This reach will convey the flow from upstream Basin A1 and the he cumulative upstream basin generation of 35.07 cfs to the eagle rock diversion. Basin A2 will drain to a new inlet and storm drain reach tied to the San Pedro storm drain. This reach will capture basin A2 as well as all the down stream basins which have a combined discharge 47.60 cfs, the 9.98 cfs from basin A and 13.94 cfs from the contributing basin to the south of Oakland will be captured, the 23.68 cfs to the northern portion is programmed to enter this reach but due to existing grades the flow will enter the storm drain within San Pedro. The contributing basins are shown on the drainage basin map located in appendix b. As shown in appendix A, the allowed discharge to this reach of the San Pedro storm drain is 45cfs, which due to grades on the northern lots will not be exceeded..

The southern half of the site contains eight onsite sub basins. The cumulative discharge from these basins is captured by inlets located at the west end of the project. Due to the phasing, phase 1-3 will temporarily retain the 100-year, 10-day volume generated. At complete build out the total flow collected by the inlets will be 7.84 cfs on the north flow line and 12.01 cfs on the south half. The cumulative flow rate of 19.85 cfs will be conveyed to the alameda storm drain via a 24" conduit. The existing inlets located within Alameda will be removed and additional inlets will be constructed at the new face of curb consistent with the ultimate condition design located in appendix C. As shown in appendix B, the maximum flow rate at each inlet will be 15.38 cfs, there for the inlets have excess capacity. As shown in the ultimate condition the storm drain is anticipated to collect 88cfs in the reach from Louisiana to the inlets we are discharging to. The northerly basin is anticipated to generate 44 cfs. Our anticipated discharge is for the northerly half is 50.06 cfs. The excess of 6.4 cfs will be attenuated with the development of the westerly commercial property owned by the same developer. As shown the remaining reach between our site and San Pedro is anticipated to collect and additional 32 cfs of which 16 cfs will be from the north, so the commercial site will be allowed to discharge 10 cfs. The attenuation of this peak can

be accomplished within commercial developments without difficulty

As shown in Appendix C, each grated inlet on a 3.3% slope has the capacity for 12 cfs. The inlets located within basin B are in a sump condition, there for each inlet has the capacity to capture the entire flow rate of the entire basin 19.92, two inlets have been added to allow for clogging. The hydraulic grade lines have not been computed with this submittal. The flow rates entering the downstream pipes have been accounted for and as shown in appendix C, the pipes have the capacity to convey the discharge without being full; therefore the hydraulic grade line of the reach will not exceed the ground level at any time. The street capacities are also shown in appendix C,

SUMMARY AND RECOMMENDATIONS

This project is a development of residential subdivision with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion. Our discharge will enter the downstream storm drain where it was anticipated. The inlets, pipes and roadways have been shown to provide the required capacity. The new storm drain within Alameda appears to have been designed such that it has less capacity than the North Albuquerque Acres plan calls for. The capacity is not a factor with this development and reduced discharge will need to be designed on the later commercial phases of this property. The site has been designed in accordance with City of Albuquerque Drainage ordinance. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity. A letter of Map revision (LOMA-F) will be required to be submitted and accepted prior to the release of building permits on annotated lots. In addition a LOMR will be required to be submitted prior to release of financial guarantee as well as prior to release of annotated lots

- Commercial/Industrial (C/I): The area west of Louisiana Boulevard, north of Modesto Avenue and east of I-25 would develop as high density commercial and industrial. Also used for Paseo del Norte Corridor.
- Medium Density Industrial (MI): Campus type commercial/office facilities and APS schools sites.
- Sandia Tribal Lands (ST): Sandia tribal lands south of Tramway Road and north of the Sandia Pueblo Grant Boundary were allocated land treatments consistent with moderate levels of development even though there are no current plans to develop this area.

The relative weight of each type of Land Treatment is shown in Table 2.

2.0 Product Information

StormTech

Figure 1 – StormTech SC-740 Chamber (not to scale)

Nominal Chamber Specifications

Size (W x H x Installed L)	51.0" (1295 mm) x 30.0" (762 mm) x 85.4" (2169 mm)
Chamber Storage	45.9 ft³ (1.30 m³)
Min. Installed Storage*	74.9 ft³ (2.12 m³)
Nominal Weight	75 lbs (34 kg)
Color	Yellow

Figure 2 – StormTech SC-310 Chamber (not to scale)

Nominal Chamber Specifications

Size (W x H x Installed L)	34.0" (864 mm) x 16.0" (406 mm) x 85.4" (2169 mm)
Chamber Storage	14.7 ft³ (0.42 m³)
Min. Installed Storage*	31.0 ft³ (0.88 m³)
Nominal Weight	37 lbs (16.8 kg)
Color	Yellow

*This assumes a minimum of 6" (152 mm) of stone below, above and between chamber rows and 40% stone porosity.

RE: **Eagle Crest Subdivision**
Drainage Report and Grading and Drainage Plan
Engineer's Stamp Date 7-3-14 (File: C18D064B)

Dear Mr. Soule:

Based upon the information provided in your submittal received 7-3-14, the above referenced submittal cannot be approved for action by the DRB on the Site Plan for Building Permit or the Preliminary Plat; nor for Grading Permit until the following comments are addressed. Please note that the following comments are cursory, and a more detailed review will be performed after the initial comments are addressed.

1. Since the proposed subdivision is partially in a Special Flood Hazard Area (AO with 1 ft. depth) an application for a LOMR is in order. However, until such time that the LOMR is approved, the City cannot issue building permits within a flood zone. Therefore, in the interest of time, it may be beneficial to raise the finished pads above the Base Flood Elevation and apply for a LOMR-F. The finished pads would have to be 1' above the highest contour elevation that crosses the lot.
2. Since this project is to be phased, a scheme to handle drainage must be determined for all the interim conditions, and also the final condition.
3. Ponding used for the management of the "first flush" should be only on the front yard as backyards are often landscaped and modified substantially.

Since the disturbed area on this site exceeds 1.0 acre, an Erosion and Sediment Control (ESC) Plan, prepared by a NM PE and approved by the City's Stormwater Engineer, will be required for this site, prior to Hydrology approval of a Building Permit or Work Order.

If you have any questions, you can contact me at 924-3695.

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 60-lot subdivision located on Oakland Avenue between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

60 units

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map 35013C0137H, the majority of the site is located within Flood Zone X; a portion of the site is impacted by flood zone AE-1 foot. AO The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The development of the site will require the site to discharge at a rate equal to or less than the fully developed conditions assumed for this site in the governing North Albuquerque Acres Master Drainage Plan (NAAMDP), which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates THAT DIVERTS TO EAGLE ROCK The upland properties have been designed to drain to the storm drain provided within Oakland. The recently constructed San Pedro and Alameda storm drain were designed to convey the developed flow from this site.

PROPOSED CONDITIONS

The proposed improvements consist of a new 60-lot subdivision serviced by public paved roadway. The lots shall free discharge to the roadway and be conveyed within the roadway to the available downstream storm drain. All the flow leaving the site will be conveyed via surface drainage to Oakland or buried storm drain to Alameda. The proposed land treatment will conform to the residential density assumptions of the NAADMP. The site discharge is reduced to these master plan assumptions by the creation of rear yard ponding and water quality ponds in front yards. Appendix B contains a unit example and calculations for the standard lot segment with roadway, where the rear portion retains only the flows generated by its self.

As shown in appendix B, the site will contain 4 onsite basins, three adjacent offsite roadway basins and one upland basin. Basin A1 and A2 contain the northern half of the subdivision which corresponds to NAAMDP basin 117.2. This basin will generate 19.96 cfs. or 9.96 cfs per basin. This flow will be conveyed within the roadways single grated type A inlets. Basin A1 drains to a new inlet to be constructed within Oakland. This storm drain reach will be constructed from the existing eagle rock diversion to the existing 24" storm drain at the west end of our site. This reach will convey the basin A-1, the Oakland frontage and the 23.68 cfs that will be accepted from upstream. Basin A2 will be captured by an inlet located at the projects west boundary. This inlet will collect the Oakland frontage and Basin A2. It has the capacity to convey

VICINITY MAP: C-18-Z

45 cfs capacity

the remaining undeveloped land down. It will connect to an existing stub from the San Pedro storm drain. Basin B1 and B2 contain the southern half of the subdivision. The flows from these basins are conveyed within Soaring Avenue to a pair of single-A inlets, in a sump condition at the west end of the project. This storm drain will convey the 19.92 cfs from these basins to the Alameda storm drain. The conduits will be connected to an existing inlet located in alameda.

This project is anticipated to be constructed in phases. In each phase the required down stream improvements will be constructed in Oakland. In the interim case for basin B1 and B2, a temporary retention pond may be constructed at the end of the pavement section. The pond shall be designed for the 100-year, 10-day volume. A phase grading plan will be required prior to grading approval.

SUMMARY AND RECOMMENDATIONS

This project is a development of residential subdivision with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion. Our discharge will enter the downstream storm drain where it was anticipated. The inlets, pipes and roadways have been shown to provide the required capacity. The site has been designed in accordance with City of Albuquerque Drainage ordinance. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity. A letter of Map revision (LOMR-F) will be required to be submitted.

- Commercial/Industrial (C/I): The area west of Louisiana Boulevard, north of Modesto Avenue and east of I-25 would develop as high density commercial and industrial. Also used for Paseo del Norte Corridor.
- Medium Density Industrial (MI): Campus type commercial/office facilities and APS schools sites.
- Sandia Tribal Lands (ST): Sandia tribal lands south of Tramway Road and north of the Sandia Pueblo Grant Boundary were allocated land treatments consistent with moderate levels of development even though there are no current plans to develop this area.

The relative weight of each type of Land Treatment is shown in Table 2.

TABLE 2

FUTURE FULL DEVELOPMENT HYDROLOGIC CONDITION ASSUMPTIONS

	Land Treatments (%)			
	A	B	C	D

EROSION CONTROL NOTES:

1. CONTRACTOR IS RESPONSIBLE FOR OBTAINING A TOPSOIL DISTURBANCE PERMIT PRIOR TO BEGINNING WORK.
2. CONTRACTOR IS RESPONSIBLE FOR MAINTAINING RUN-OFF ON SITE DURING CONSTRUCTION.
3. CONTRACTOR IS RESPONSIBLE FOR CLEANING ALL SEDIMENT THAT GETS INTO EXISTING RIGHT-OF-WAY.
4. REPAIR OF DAMAGED FACILITIES AND CLEANUP OF SEDIMENT ACCUMULATIONS ON ADJACENT PROPERTIES AND IN PUBLIC FACILITIES IS RESPONSIBILITY OF THE CONTRACTOR.
5. ALL EXPOSED EARTH SURFACES MUST BE PROTECTED FROM WIND AND WATER EROSION PRIOR TO FINAL ACCEPTANCE OF ANY PROJECT.

NARRATIVE

THE REAR YARDS POND AND DO NOT DISCHARGE. THIS REDUCES THE EFFECTIVE BASIN AREA OF THE LOT. TO CALCULATE ~~THE~~ WHAT THIS TOTAL YARD DISCHARGE IS EQUAVALENT TO WE DETERMINED THE TOTAL DISCHARE IS .64 CFS. WE THEN ITTERATE THE LAND TREATMENTS ON THE ENTIRE UNIT AREA TO COME UP WITH AN EQUIVALENT LAND TREATMENT AREA. AS SHOWN THIS EQUIVALENT AREA IS EQUAL TO THE DEVELOPED CONDITION ASSUMPTIONIN THE NAA MDP. IN ADDITION THE FRONT YARDS WILL HARVEST ADDITIONAL ~~33~~ 165 CF.

~~Vicinity~~

165 cf in front yard only.

Re: Eagle Crest Subdivision
Grading and Drainage Plan
Engineer's Stamp Date 1/28/14 and
Drainage Report
Engineer's Stamp Date 1-25-14
Drainage file number (C18D064B)

Dear Mr. Soule,

Based upon the information provided in your submittal received 1-28-14, the above referenced plan and report are approved for Preliminary Plat action by the DRB.

Grading Permit can be approved after the DRB has approved the Preliminary Plat and the Erosion and Sediment control plan has been approved and accepted.

If you have any questions, you can contact me at 924-3986 or Rudy Rael at 924-3977.

Sincerely,

Curtis Cherne, P.E.

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 68-lot subdivision located on Oakland Avenue between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map35013C0137H, the majority of the site is located within Flood Zone X; a portion of the site is impacted by flood zone AE-1 foot. The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The development of the site will require the site to discharge at a rate equal to or less than the fully developed conditions assumed for this site in the governing North Albuquerque Acres Master Drainage Plan (NAAMDP), which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates. The upland properties have been designed to drain to the storm drain provided within Oakland. The recently constructed San Pedro Storm drain was designed to convey the developed flow from this site.

PROPOSED CONDITIONS

The proposed improvements consist of a new 68-lot subdivision serviced by a private paved roadway. The lots shall free discharge to the roadway and be conveyed to the west within the roadway. All the flow leaving the site will be conveyed via buried storm drains. The proposed land treatment will conform to the residential density assumptions of the NAADMP. As shown in appendix B, the site will contain 3 onsite basins, three adjacent offsite roadway basins and one upland basin. Basin A is the southern half of the subdivision which corresponds to NAAMDP basin 117.3. This basin will generate 21.73 cfs. This flow will be conveyed within the Aerie Roadway and captured by one double grated A inlet and two single grated inlets located at the western end of the street. Basin B contains the northwest portion of the site corresponding to basin 117.2. This basin will generate14.36 cfs which will be conveyed within the Soaring Roadway and captured by an one double grated A inlet and two single grated inlets located at the north west end of the street. Basin C contains the remaining northeast portion of the site which corresponds to the diverted portion of basin 117.2. This basin generates 9.05 cfs. This flow is conveyed within the eastern portion of Soaring, and captured by two single A inlets located east of High Cliff. Basin Oak 1 contains the southern half of Oakland below the Eagle rock diversion, this basin generates 1.91 cfs, this flow is captured by a single A inlet located at the western end of the project. Basin Oak 2 contains the southern half of Oakland east of the Eagle rock diversion, and generates 1.89 cfs, this flow is captured by a single A inlet

located east of High Cliff. The upland flow that we need to accommodate is Upoak 3. This basin contains the future development of basin 117.2. This basin will have 23.68 cfs generated. The flow from this inlet will be captured upstream and enter our limits within an existing storm drain. The alameda expansion is ALA1. This basin will generate 6.65 cfs, this discharge will be captured by the existing inlets located with Alameda, that have been designed for fully developed condition.

The development of this site will conform to the design parameters of the NAAMDP. The conveyance to the San Pedro Storm drain will be modified due to the moratorium for work in Alameda. As shown in the San Pedro storm drain the flows from Basins 117.2 are conveyed within San Pedro with the same drainage system. We will convey basin A to the north where is combines with basin B and oak 1, generating a total of 38 cfs which will be conveyed within a new 24" storm drain within Oakland, connecting to the San Pedro Stub at Oakland. This diversion has no impact on the storm drain function. The remaining portion of downstream basin 117.2 will generate 36.09 cfs, this will be captured by inlets at the time of development. Therefore the total flow entering the storm drain at San Pedro and Oakland will be 74.09, which is less than proposed within the NAAMDP. The model of this reach of storm drain is labeled lower Oakland in appendix C.

The flows from onsite C, oak 2 and up oak 3 will be conveyed by the connection of the existing 30" storm drain east of this site with the diversion stub provided just west of High cliff. This diversion is in accordance with the Eagle rock diversion. The model of this reach is labeled upper Oakland in appendix C. The Alameda storm drain has not been modeled since no new pipe is proposed and the fully developed condition was anticipated. No work will be done in Alameda at this time due the moratorium, at the time permission is granted adjustment of any affected inlets will be done with work order.

SUMMARY AND RECOMMENDATIONS

This project is a development of residential subdivision with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion. Our discharge point will enter the downstream storm drain farther down stream than initially planned, but the capacity and conveyance of the overall system will remain unchanged. The site has been designed in accordance with City of Albuquerque Drainage ordinance which each site will retain the first .41" of rain. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity. A letter of Map revision (LOMR-F) will be required to be submitted.

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

Site Grading and Drainage Plan

PURPOSE

The purpose of this report is to provide the Drainage Management Plan for the development of a 68-lot subdivision located on Oakland Avenue between San Pedro and Louisiana NE. This plan was prepared in accordance with the City of Albuquerque design regulations, utilizing the City of Albuquerque's Development Process Manual drainage guidelines, and HYDROCAD. This report will demonstrate that the grading does not adversely affect the surrounding properties, nor the upstream or downstream facilities.

INTRODUCTION

The subject of this report, as shown on the Exhibit A, is a 12.41-acre parcel of land located on the south side of Oakland Avenue and the north side of Alameda Boulevard between San Pedro and Louisiana. The legal description of this site is Lots 4-10 and 23-29, block 28, tract A, unit B, North Albuquerque Acres. As shown on FIRM map35013C0137H, the majority of the site is located within Flood Zone X; a portion of the site is impacted by flood zone AE-1 foot. The site has had significant grading activities upon it over the past 10 years. The site is not in native condition. Due to the upstream construction, the site is not affected by any upland flow. The site free discharges to the west. The development of the site will require the site to discharge at a rate equal to or less than the fully developed conditions assumed for this site in the governing North Albuquerque Acres Master Drainage Plan (NAAMDP), which relevant excerpts can be found in appendix A.

EXISTING CONDITIONS

The site currently does have structures on it and has been impacted by human development over the years. The site was most recently an auto salvage and parts yard. The site is not impacted by any upland flows. The site currently discharges all of its flow to the North West

corner of the site. The site is located within basins 117.2 and 117.3 of the NAAMDP. The NAAMDP design analysis has been modified by the Eagle Rock drainage plan. The diversion of the upper 57% of basin 117.2 was designed with the construction of Oakland estates. The upland properties have been designed to drain to the storm drain provided within Oakland. The recently constructed San Pedro Storm drain was designed to convey the developed flow from this site.

PROPOSED CONDITIONS

The proposed improvements consist of a new 68-lot subdivision serviced by a private paved roadway. The lots shall free discharge to the roadway and be conveyed to the west within the roadway. All the flow leaving the site will be conveyed via buried storm drains. The proposed land treatment will conform to the residential density assumptions of the NAADMP. As shown in appendix B, the site will contain 3 onsite basins, three adjacent offsite roadway basins and one upland basin. Basin A is the southern half of the subdivision which corresponds to NAAMDP basin 117.3. This basin will generate 21.73 cfs. This flow will be conveyed within the Aerie Roadway and captured by two single A inlets located at the western end of the street. Basin B contains the northwest portion of the site corresponding to basin 117.2. This basin will generate14.36 cfs which will be conveyed within the Soaring Roadway and captured by an single A inlet located at the north west end of the street. Basin C contains the remaining northeast portion of the site which corresponds to the diverted portion of basin 117.2. This basin generates 9.05 cfs. This flow is conveyed within the eastern portion of Soaring, and captured by two single A inlets located east of High Cliff. Basin Oak 1 contains the southern half of Oakland below the Eagle rock diversion, this basin generates 1.91 cfs, this flow is captured by a single A inlet located at the western end of the project. Basin Oak 2 contains the southern half of Oakland east of the Eagle rock diversion, and generates 1.89 cfs, this flow is captured by a single A inlet

located east of High Cliff. The upland flow that we need to accommodate is Upoak 3. This basin contains the future development of basin 117.2. This basin will have 23.68 cfs generated. The flow from this inlet will be captured upstream and enter our limits within an existing storm drain. The alameda expansion is ALA1. This basin will generate 6.65 cfs, this discharge will be captured by the existing inlets located with Alameda, that have been designed for fully developed condition.

The development of this site will conform to the design parameters of the NAAMDP. The conveyance to the San Pedro Storm drain will be modified due to the moratorium for work in Alameda. As shown in the San Pedro storm drain the flows from Basins 117.2 are conveyed within San Pedro with the same drainage system. We will convey basin A to the north where ~~is~~ it combines with basin B and oak 1, generating a total of 38 cfs which will be conveyed within a new 24" storm drain within Oakland, connecting to the San Pedro Stub at Oakland. This diversion has no impact on the storm drain function. The remaining portion of downstream basin 117.2 will generate 36.09 cfs, this will be captured by inlets at the time of development. Therefore the total flow entering the storm drain at San Pedro and Oakland will be 74.09, which is less than proposed within the NAAMDP. The model of this reach of storm drain is labeled lower Oakland in appendix C.

The flows from onsite C, oak 2 and up oak 3 will be conveyed by the connection of the existing 30" storm drain east of this site with the diversion stub provided just west of High cliff. This diversion is in accordance with the Eagle rock diversion. The model of this reach is labeled upper Oakland in appendix C. The Alameda storm drain has not been modeled since no new pipe is proposed and the fully developed condition was anticipated. No work will be done in Alameda at this time due the moratorium, at the time permission is granted adjustment of any affected inlets will be done with work order.

SUMMARY AND RECOMMENDATIONS

This project is a development of residential subdivision with the North Albuquerque Acres Master Drainage plan. The development is consistent with the land use assumptions of the plan. The surrounding development altered the upland and onsite basin by the creation of a diversion from Oakland to Eagle rock. Our plan conforms to this diversion. Our discharge point will enter the downstream storm drain farther down stream than initially planned, but the capacity and conveyance of the overall system will remain unchanged. The site has been designed in accordance with City of Albuquerque Drainage ordinance which each site will retain the first .41" of rain. This drainage plan and report conforms to the governing drainage regulations of the City. Since the effected area site encompasses more than 1 acre, a NPDES permit will be required prior to any construction activity. A letter of Map revision (LOMR-F) will be required to be submitted.

- Commercial/Industrial (C/I): The area west of Louisiana Boulevard, north of Modesto Avenue and east of I-25 would develop as high density commercial and industrial. Also used for Paseo del Norte Corridor.
- Medium Density Industrial (MI): Campus type commercial/office facilities and APS schools sites.
- Sandia Tribal Lands (ST): Sandia tribal lands south of Tramway Road and north of the Sandia Pueblo Grant Boundary were allocated land treatments consistent with moderate levels of development even though there are no current plans to develop this area.

The relative weight of each type of Land Treatment is shown in Table 2.

TABLE 2

FUTURE FULL DEVELOPMENT HYDROLOGIC CONDITION ASSUMPTIONS

	Land Treatments (%)			
	A	B	C	D
Sandia Heights/Tramway (SH/TB)	20	40	5	35
North Albuquerque Acres (NAA)	22	23	38	17
Low Density Residential (LR)	20	20	34	26
Residential (R)	0	34	16	50
High Density Residential (HR)	0	25	15	60
Commercial/Industrial (C/I)	0	20	10	70
Medium Density Industrial (MI)	0	20	30	50
Sandia Tribal Lands (ST)	20	20	40	20
Primrose Pointe (PP)	0	40	20	40

Re: Eagle Crest Subdivision
Grading and Drainage Plan
Engineer's Stamp Date 1-23-14 (C18D064B)

Dear Mr. Soule,

Based upon the information provided in your submittal received 1-24-14, the above referenced plan cannot be approved for Preliminary Plat action by the DRB until the following comments are addressed.

1. Half the flows are not accounted for in Soaring St. and Aerie St. – spreadsheet doesn't
2. A different flow calculation is needed for the west ends of Soaring St. and Aerie St. change by adding inlet
3. Label the streets on the G&D plan. ✓
4. A different typical lot layout is needed for Soaring St. and Aerie St. showing flows leaving the lots through the front. ✓
5. The typical water harvesting area should be reverse or flipped to avoid any possible chance of confusion. ✓
6. Show the 24" wye just to the west of the commercial site from San Pedro. This wye should be the storm drain connection for the commercial site. ✓
7. For the proposed lot 47, it appears the FF is 1.6 feet above the FP grade. ✓
8. At the west end of Soaring St. and Aerie St. an arrow should be placed showing an emergency overflow escape path into the commercial site just to the west. ✓
9. Show TOW and BOW. ✓
10. Show the size of the SD pipe in Oakland heading north. What are the inverts? ✓
11. All new text should be bolded. ✓

The Grading Permit can be approved after DRB has approved the Preliminary Plat and the Erosion and Sediment control plan is also approved.

If you have any questions, you can contact me at 924-3986 or Rudy Rael at 924-3977.

Sincerely,

Curtis Cherne, P.E.

Requests for approvals of Site Development Plans and/or Subdivision Plats shall be accompanied by a drainage submittal. The particular nature, location, anc scope to the proposed development defines the degree of drainage detail. One or more of the following levels of submittal may be required based on the followin

1. **Conceptual Grading and Drainage Plan**: Required for approval of Site Development Plans greater than five (5) acres and Sector Plans
2. **Drainage Plans**: Required for building permits, grading permits, paving permits and site plans less than five (5) acres
3. **Drainage Report**: Required for subdivision containing more than ten (10) lots or constituting five (5) acres or more
4. **Erosion and Sediment Control Plan:** Required for any new development and redevelopment site with 1-acre or more of land disturbing area, including project less than 1-acre than are part of a larger common plan of development

To: 'David Soule'; Gallegos, Wilfred A.
Cc: Wolfe, Bryan K.; Rael, Rudy E.
Subject: RE: Storm drain alignment-Eagle Crest Subd

David,
I just met with Wilfred Gallegos and Bryan Wolfe concerning the horizontal alignment of the storm drain. First, I informed Wilfred that the subdivision has private streets. That changed the conversation and DMD recommends the storm drain be privately maintained.

So I feel better about it, show a flow arrow pointing west in the tract to the west labeled Emergency Spillway or similar and a Private Facilities Drainage Covenant is required. The Covenant should be on the Infrastructure List and will be required prior to Work Order or Final Plat approval.

Curtis

Subject: Storm drain alignment

Wilford, I am requesting your comments on the proposed alignment of our storm sewer. My client owns all the property in question. Curtis feels out alignment should be within our subdivsion. I understand Curtis's reasoningc but I really would like to keep it the way I have shown. The adjacent parcel is zones SU2 for C2, My logic is there will be a buffer required between the residential subdivision and any buildings. The line will be in an easement that the city has say over. Any development on the adjacent tract will be dealing with this easement in addition to the ABCWUA easement right next to it, and is zoned su2 so drb has control of the site plan approval. The alternate alignment would be to adjust the lots and have 20' easement interior, I propose what I have would be easier to maintain. Curtis has authorized me to inquire with you since your department will be the maintainer of the line. I will adjust the layout if you do not accept what I propose, but my client wants me to ask

Re: Eagle Crest Subdivision
Grading and Drainage Plan
Engineer's Stamp Date 12-21-13 (C18D064B)

Dear Mr. Soule,

Based upon the information provided in your submittal received 12-23-13, the above referenced plan cannot be approved for Preliminary Plat action by the DRB until the following comments are addressed.

1. The horizontal location of the storm drain, west of the subdivision, should be located in the subdivision or in a public drainage easement. This easement can be placed in the proposed lot number 68 in the NW corner and enlarging lots 67-56 evenly.
2. A LOMR-F is not sufficient for this subdivision, a LOMR is required.
3. Make the proposed contour labels larger, and add existing contours with a lighter line.
4. A Flood plain permit is needed before any work commences.
5. The proposed 24" storm drain within Oakland does not appear to carry enough flow for the proposed 74.09 cfs. A quick calculation using Manning's equation proved that a 30" pipe would be the sufficient size.
6. Show the 24" wye just to the west of the commercial site from San Pedro. This wye should be the storm drain connection for the commercial site.
7. The proposed HDPE is not allowed in traffic right of ways, change to RCP.
8. For the proposed lots 39-55, it appears the FF is 2 feet above grade causing a 10% slope for the driveway and the backyard. This slope is not recommended for drives and yards. What is the reasoning for this height?
9. For the proposed lots 39-55, turn a block with openings facing out at least 6" above grade or at pad level, with fabric placed in front, to avoid erosion and sediment escaping out onto the sidewalk and road.

PO Box 1293
Albuquerque
New Mexico 87103
www.cabq.gov

The Grading Permit can be approved after DRB has approved the Preliminary Plat and the Erosion and Sediment control plan is also approved.

If you have any questions, you can contact me at 924-3986 or Rudy Rael at 924-3977.

Sincerely,

Curtis Cherne, P.E.

RE: Revised Grading and Drainage Plan
Eagle Crest Subdivision
C18-D064B

Dear Mr. Cherne:

The purpose of this letter is to accompany the enclosed revised grading plan for the referenced project. This plan has been modified to address your comments dated January 9, 2014. The following is a summary of your comments with the annotation as to how the plans were modified to address the comments.

1. The horizontal location of the storm drain west of the subdivision should be located within the subdivision or a public drainage easement. This easement can be placed in the proposed lot 68
   The developer owns the lots west of this site. After discussions I understand the concern is the ability to maintain the line. We feel the alignment inside the subdivision on lot 68 compared to being in a public drainage easement on the adjacent tract, which will be commercial is less accessible than what we propose. There for we request reconsideration of the upgraded existing alignment be maintained. To assist in the maintenance and accessibility we have revised the plan to show driveway cut and crusher fine surface. In the future this area will be a buffer between the residential and commercial, and any improvements if allowed would need to be acceptable to the city and will be entirely at the city discretion. I believe this alignment serve the public best.

2. A LOMR-F is not sufficient
   The LOMR-F was a mistype; a LOMR will be required and is on the infrastructure list.

3. Make contour labels larger.
   We have changes the scale and line weight so the labels are legible.

4. A Flood Plain permit is required prior to work commencing
   Acknowledged

5. The proposed 24" storm drain within Oakland does not appear to carry enough flow, for 74.09 cfs, provide 30"
   We have increased the pipe size to 30" for the reach in question

6. Show the 24" wye just west of san pedro to the commercial site
   We have added this information to the plan.

7. HDPE not allowed in traffic right of ways
   We have changed all of the pipe to RCP

RECEIVED
JAN 17 2014
LAND DEVELOPMENT SECTION

8. For the proposed lots 39-55 it appears the ff is 2' above grade causing 10% driveways, what is reasoning?
   The grade of the pad was set by using the highest elevation at the front property line, then rising along that side yard at 1% to the break point at the middle of the lot. We set *our finished floor 6" above this. The slope of the road is over 3% and the lots are 50'* wide so there is 1.5' of fall across the lot, I would expect the builder to build the driveway on the high side.
9. For the proposed lots 39-55 turn blocks with at 6" above grade or at pad level with erosion protection
   We have added turned blocks We have placed them at finished grade at edge or right of way. We have added note about 2' wide cobble protection to provide adequate overflow for these lots

It is understood a grading permit can only be approved once DRB approves the plan and an Erosion and sediment control plan is approved. Thank you for your comments.
Should you have any questions regarding this re-submittal, please do not hesitate to call me.

Sincerely,

David Soule, PE

Traffic Impact Study
Engineer's Stamp dated 04-19-16 (C18-D064B)

Dear Mr. Harwick,

The subject Traffic Impact Study received on April 19, 2016 has been reviewed and approved by the Transportation Development Section. All comments have been adequately addressed.

The final Traffic Impact Study shall be valid for a period of three years. Should significant modifications to the approved development proposal occur, the approved study shall be revised to incorporate the changes.

If you have any questions, please feel free to contact me at (505) 924-3991.

Sincerely,

Racquel M. Michel, P.E.

Hi Nevin,
So sorry, I forgot to send this last week.

Based upon the information provided in your submittal received 01-18-16, Transportation Development cannot approve the TIS for the above referenced project.

Prior to approval, the following items must be addressed:

- The commercial entrance on Alameda does not appear to match up to the existing median cut.
- Please add a recommendation for re-striping on San Pedro.

Once corrections are complete resubmit along with a completed Drainage Transportation Information Sheet to front counter personnel for log in and evaluation by Transportation. For digital submittal please submit to PLNDRS@cabq.gov. If you have any questions, please contact me at (505) 924-3991.

Thanks,

Subject: Legacy TIS
Importance: High

Racquel,

Thanks for the call on Tuesday. I was wondering if you would please summarize your comments in an e-mail so we have that for the record. You were correct on your primary comment concerning the median opening alignment with the commercial driveway. The primary change in the final report is the discussion of shortening the westbound left-turn lane on Alameda Blvd @ San Pedro Dr to accommodate the site access. This has no impact on the left-turn lane operations as the volume on that approach is very small. There are also some minor changes to the commercial site plan.

Again if you would forward me your comments, I'd appreciate it. I look forward to hearing from you so we can finalize the project. Thanks.

Take care.
