SECTION 1 – PURPOSE

The purpose of this drainage report is to establish the drainage flows for two drainage watersheds. First is the Paseo del Norte (PdN) Corridor between Golf Course Road and Kimmick Road. The second is the Universe Blvd south of the Grant line and Unser Blvd NW from The Trails Unit IV to the Proposed Boca Negra Dam. This report will analyze the ultimate flows from Paseo del Norte and Unser Blvds into Piedras Mercadas Arroyo and Unser and Universe Blvds into Boca Negra Dam.

1.1 Introduction

This report summarizes proposed hydrologic conditions; provides the design for fully developed peak flows; provides recommendations; and evaluates downstream drainage capacities.

1.2 Existing Reports

Existing drainage reports providing information used in this report include:

“La Cuentista Subdivision Drainage Report”, dated November 2003, by Wilson & Company, Inc.

“Paseo del Norte Drainage Report”, dated August 16, 2004, by Wilson & Company, Inc.

“Amendment to the Trails Unit II Drainage Master Plan”, dated August 2007, by Wilson & Company, Inc.

Guidelines and recommendations from the above reports were incorporated into this drainage report where possible.

SECTION 2 - HYDROLOGIC ANALYSIS

The area includes two watersheds: The first watershed accepts storm water runoff between north of proposed Paseo del Norte and west of proposed Unser Blvd into the Piedras Marcadas Arroyo. The second watershed accepts storm water runoff from east and west of Universe Blvd. and east of Unser Blvd. south of Paseo del Norte Blvd. into the proposed Boca Negra Dam. See Figure 1 for Vicinity map.

2.1 Methodology

Hydrologic modeling for this report is performed using the 1997 version of The Arid-Lands Hydrologic Model (AHYMO) in accordance with the City of Albuquerque Development process Manual (DPM), section 22.2, December 1999 for the given 100-year, 6-hour storm event. The AHYMO input, summary and output files for the developed conditions are included in Appendix A. Hydraflow Storm Sewers 2005 software by Intelsolve was used to size the underground storm systems. See Appendix B for calculations summary.

2.2 Design Storm Precipitation

AHYMO was used to calculate proposed runoff. The rainfall values used were for the 1 and 6 - hour precipitation for a 100 year storm event. Rainfall values were obtained from precipitation frequency data server NOAA Atlas 14.

| 100 | 2.2 | 1.7 |
|-----|-----|-----|
|-----|-----|-----|

2.3 Land Treatments

Proposed land treatment percentages used in the AHYMO Computer model are based on the original Paseo del Norte drainage report dated August 2004. See Table 2 below for land treatment percentages.

Table 2: Land Treatment Percentages

| Land Use | Type A | Type B | Type C | Type D |
|------------------------|--------|--------|--------|--------|
| Residential/Town homes | 0% | 15% | 35% | 50% |
| Residential | 0% | 10% | 40% | 50% |
| Commercial | 0% | 10% | 10% | 80% |
| Open Space | 100% | 0% | 0% | 0% |
| Roadway | 0% | 10% | 0% | 90% |

2.1 Existing and Proposed Conditions

2.4.1 Existing Conditions

The existing topography slopes generally from west to south and southeast. The downstream section of the storm drain system in Paseo del Norte is currently built. The existing storm drain system includes 2700 LF of 72" RCP which joins approximately 530 LF of 84" RCP. This system connects to an 84" RCP which discharges into an RCP box along with a pipe parallel to it. Flows then ultimately drain into the Piedras Marcadas Arroyo.

2.4.2 Proposed Conditions

The Unser and Paseo del Norte Blvds sub-basins have been modeled with 3 detention ponds. Pond 1 detains flows from sub-basins west of proposed Unser Blvd while Pond 2 detains flows from sub-basins between north of proposed Paseo del Norte and east of Unser Blvds. The outlet pipe from Pond 2 is connected into the existing 72" pipe. Flows detained from Ponds 1, 2 and 9 is added to the runoff from open space and other sub-basins north of Paseo del Norte which ultimately drain into the existing concrete culvert boxes discharging into the Piedras Marcadas

Arroyo. A small basin immediately north of proposed Paseo del Norte Blvd. and west of proposed Unser Blvd. drains into Pond 10 which is ultimately directed south and therefore separated from flows into Proposed Paseo del Norte Blvd.

Universe and Unser Blvds. sub-basins include 3 detention ponds with Pond 3 connected to the Unser Blvd. storm drain system and ultimately discharging into the proposed Boca Negra Dam. Flows generated east and west of Unser Blvd. below elevation 5339 are not part of proposed Unser Blvd. storm drain system. Flows generated in Ponds 4 and 5 which are located in SAD 228 connect to the storm drain system carrying the overflow from the Boca Negra Dam which is discharged into the Mariposa Arroyo.

Pond 6 is a shallow pond detaining flows generated in the sub-basin north of it which is then discharged south. Ponds 7 and 8 detain flows before discharging allowable flows into the Mariposa Arroyo. Refer to Plate 1 in Appendix B for pond locations. See Table 3 for Basin Summary.

| BASIN | AREA (ACRES) | AREA (ACRE) | POND 1 PRE-DRY VOLUME | | | | Q _{MAX} (GFS) | VOLUME (ACFT) |

SECTION 3 – HYDRAULIC ANALYSIS

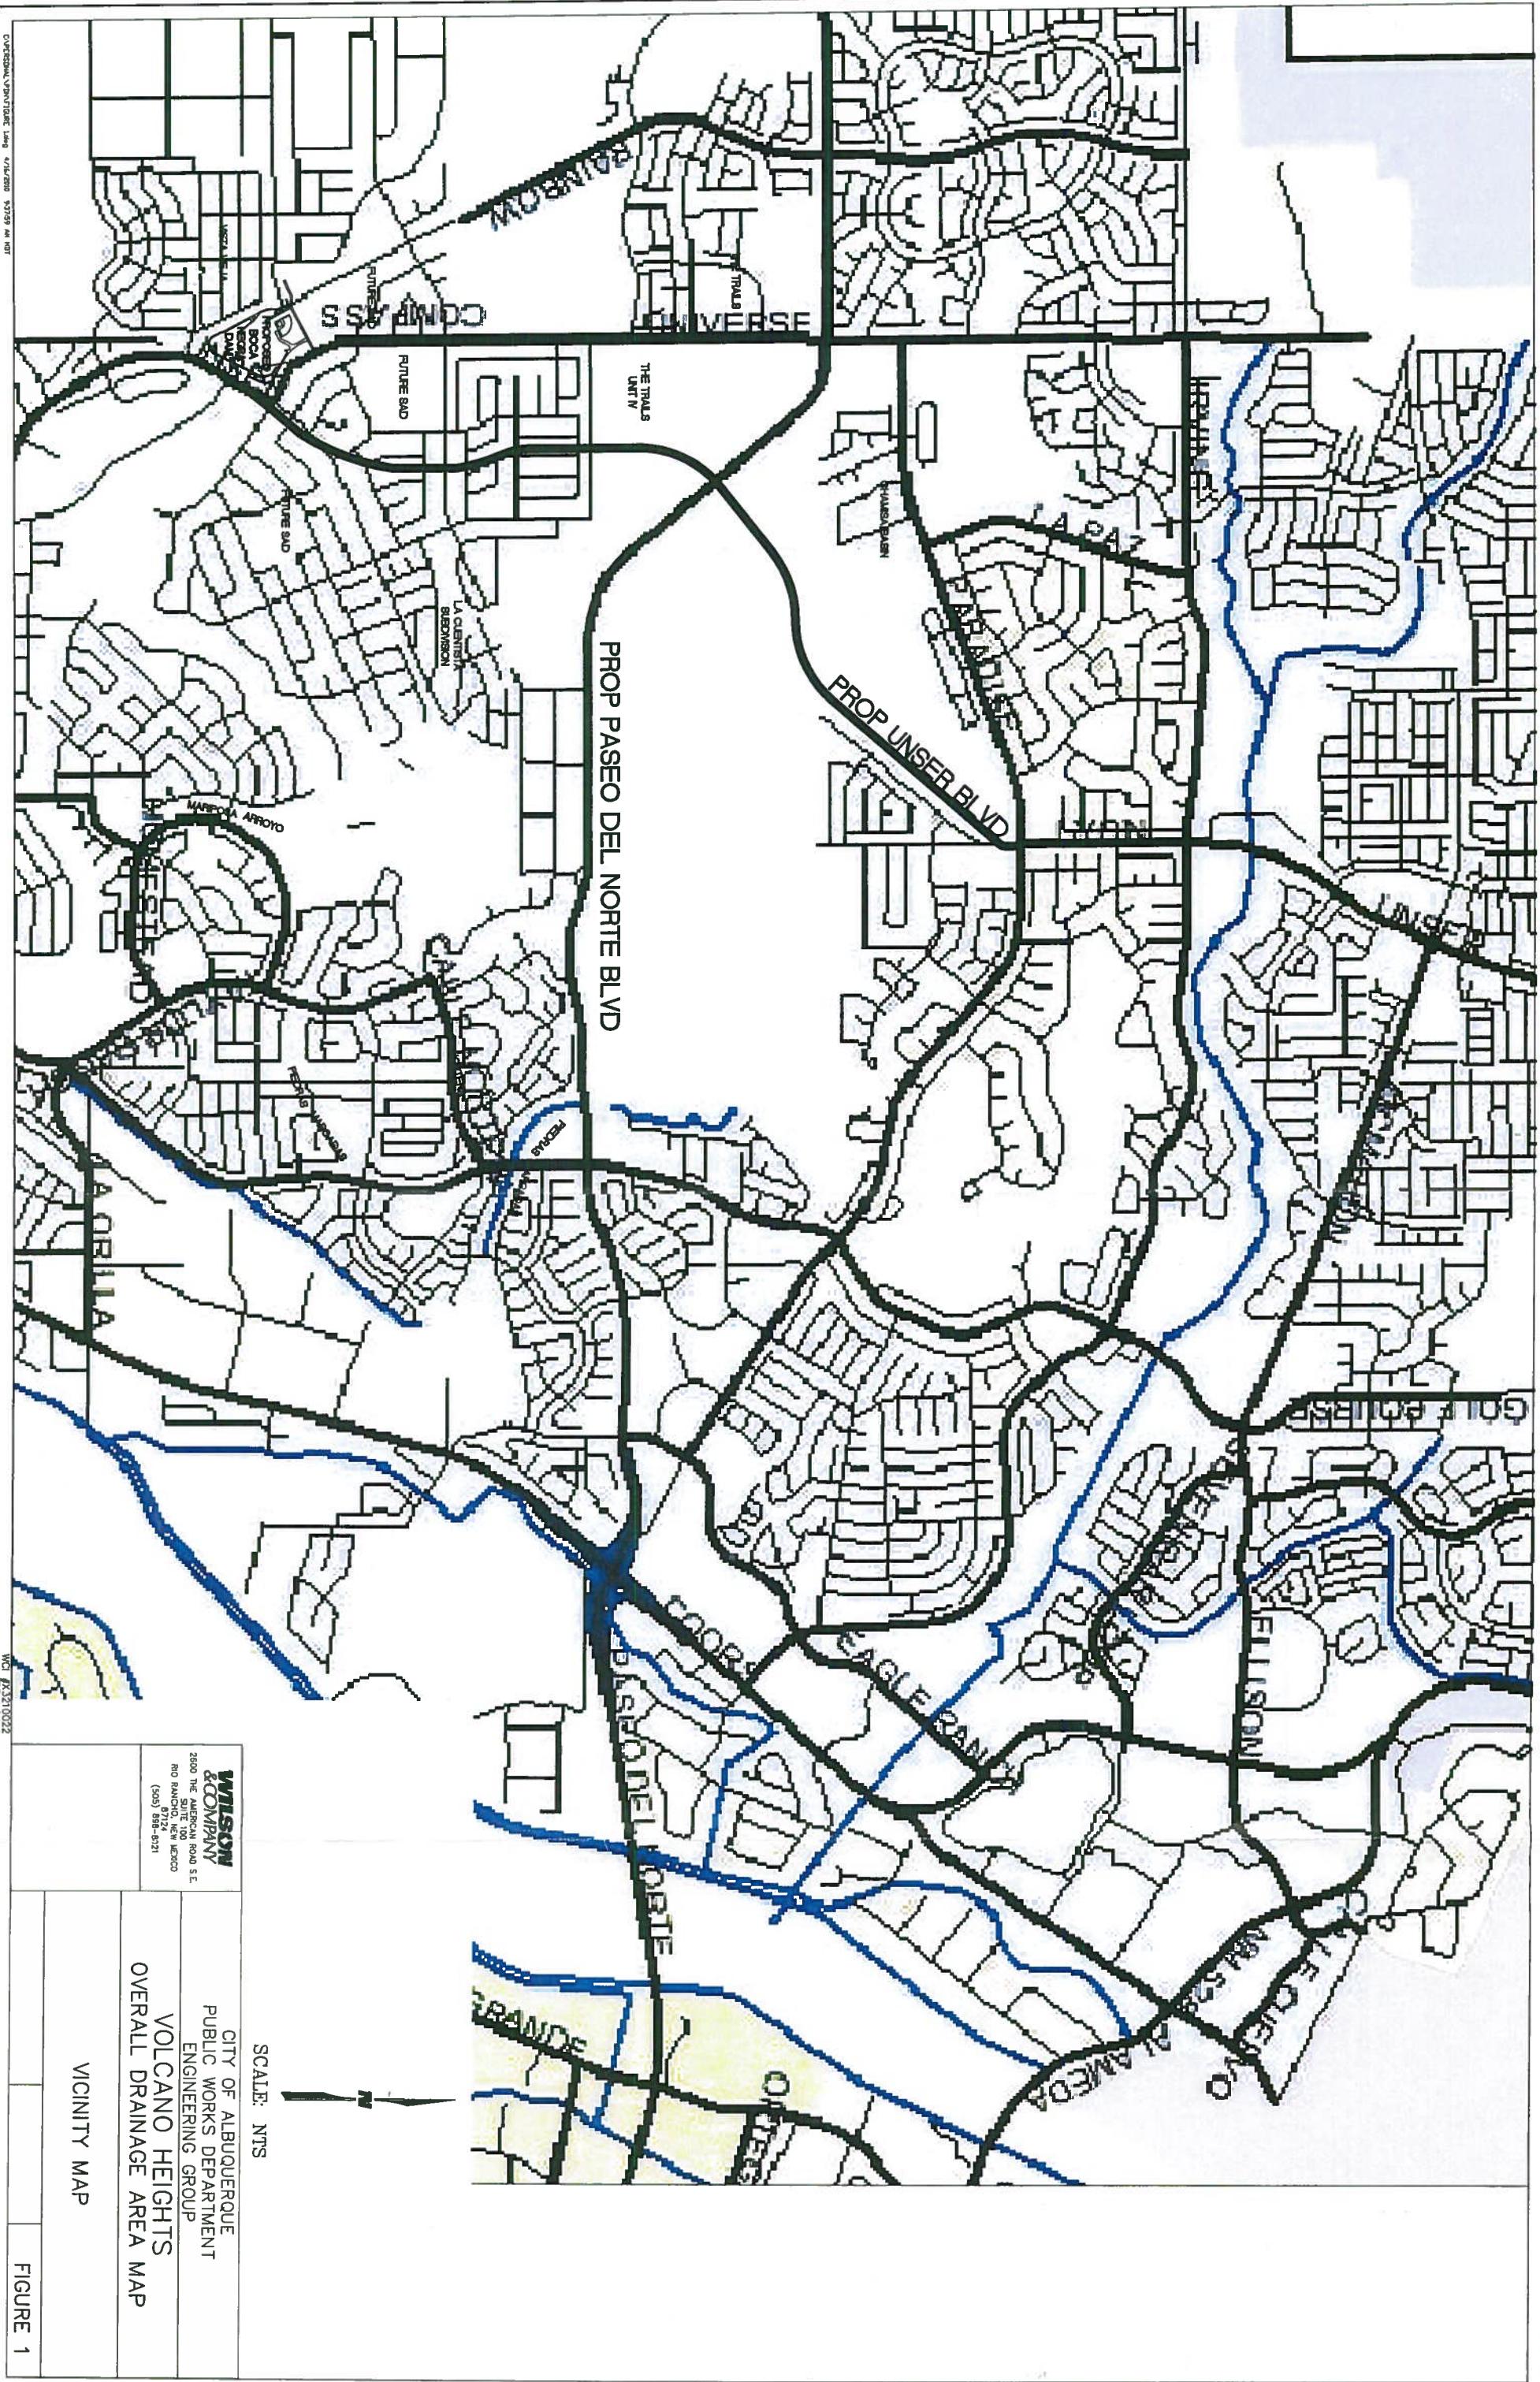

3.1 Storm Drain Analysis

Analyses for these systems were modeled using HydraFlow Storm Sewers 2005 by Intelisolve. The conceptual storm drain systems may be found on Plate 1 in Appendix B.

SECTION 4 - CONCLUSION AND RECOMMENDATIONS

Proposed storm drain facilities are designed to convey developed runoff. Pipe sizes are noted on Plate 1. Although the Paseo del Norte storm drain system works with the number of ponds shown on Plate 1, it is recommended that a detention pond upstream of Pond 2 be added to decrease flow amount draining into Pond 2 and reducing pipe sizes. The following is a summary of the 100 year design flows recommended to be used for the design of proposed Paseo del Norte and Unser Blvds.

| Location | Design Flow (cfs) | |
|----------|--|-----|
| AP1 | PdN at the Petoglyph national Monument | 625 |
