PURPOSE OF REVISED REPORT

The purpose of this drainage report is to present historic and proposed drainage conditions for the area pertaining to this site to obtain preliminary and final plat approval. This report has been slightly revised and expanded from the preliminary report submitted with the County Subdivision Package to provide greater detail and additional calculations.

METHODOLOGIES

Site conditions will be analyzed for a 10-year and 100-year, 6-hour storm in accordance with the County of Bernalillo Drainage Ordinance and the City of Albuquerque proposed revisions to Section 22.2, Hydrology of the Development Process Manual (DPM), August 1991.

SITE DESCRIPTION AND CHARACTERISTICS

The site, Sandia Heights South, Units 21 and 22, is located on the southwest corner of Tramway Boulevard and San Rafael. The approximately 13.5 acre site proposes to be developed into 86 lots of single family dwelling units. The main road is oriented north/south through the site and will provide access from Tennyson Street. Tennyson Street provides the west boundary of the site and intersects San Rafael. San Rafael provides the north boundary of the site and intersects with Tramway Boulevard. Tramway Boulevard provides the east boundary of the site and is currently concluding reconstruction. We have coordinated the grading and drainage concepts of this plan with Tramway's concluding reconstruction.

The site area is currently vacant and consist of southwest desert vegetation. Site soils are classified by the SCS's "Soil Survey of Bernalillo County" as those within the Embudo-Tijeras Complex and Tijeras gravelly fine sandy loam, which consist of gravely sandy loam with medium to moderate runoff (class B) and the hazard of water erosion is moderate. The site is not located in a FEMA Floodway.

EXISTING HYDROLOGIC AND SITE DRAINAGE CONDITIONS

Existing site drainage is limited to that generated within the boundaries of the property being studied as well as three small offsite watersheds located at the eastern proposed property boundary and the recent reconstructed edge of pavement on Tramway Boulevard. An offsite watershed north of the proposed property boundary, in San Rafael right-of-way, contributes no flow to existing onsite watersheds but drains to a natural channel on the west side of Tennyson.

Two 24" diameter CMP's are currently placed across Tennyson Street just south of San Rafael. Currently, Basins A, B, and Offsite Basin 2 discharge approximately 5 cfs in a 10-year and 10 cfs in a 100-year 6-hour storm event into the culverts. This discharge, together with Offsite Basin 1, discharge approximately 7 cfs in a 10 year and 13 cfs in a 100-year 6-hour storm event into the existing natural arroyo west of Tennyson(note that these values do not include discharge that flowed to the existing CMP's from the east side of Tramway before reconstruction of Tramway Boulevard). Please refer to the enclosed sheet entitled "Existing Drainage Conditions.

The center portion of the undeveloped site (Basins C, D, E, F) and offsite Basin 3 generate approximately 8 cfs in the 10-year storm event and 20 cfs in the 100-year storm event and discharge to Tennyson Street and then westerly to vacant lands. Basin hydrology data and calculations may be found in Appendix A of this report.

The southerly site basins, Basins G, H,and Offsite Basin 4, drain directly to the Arroyo del Pino with total flows of 2.11 cfs and 4.38 cfs in the 10-year and 100-year storm events, respectively.

PROPOSED (DEVELOPED) HYDROLOGIC AND HYDRAULIC CONDITIONS

Please refer to the Proposed Terrain Management and Grading/Drainage Plan enclosed with this report.

In most cases, runoff from each residential lot will be collected in the public street and drained to the Tennyson access intersections at Del Rey and Santa Monica, where most of the flows are collected into drop inlets. The north Tennyson access intersection at Del Rey provides two inlets that collect and conveys a portion of the runoff (10 cfs) to the existing two 24" diameter CMP's, which in-turn discharge into the existing arroyo. According to the County of Bernalillo drainage files and Michael E. Beyer PE, the CMP's are allowed to carry an ultimate developed flow rate of 37.3 cfs(memo dated 3/09/92, Case No.: BP-91-393, Zone Map No.: D-22).

The residual flow (6.84 cfs) that bypasses the drop inlets at the north Tennyson access intersection (Del Rey) will, together with any flow from Tennyson Street itself, be collected in drop inlets located along the sag of Tennyson Street(approximately the same location as the two existing culverts). The southern Tennyson access intersection at Santa Monica provides three inlets that convey a collected portion of runoff (18 cfs) to a storm drain, which in-turn discharges to the Tramway/Arroyo del Pino crossing structure, south of the site. The residual flow (12.82 cfs) not collected in the drop inlets along the south Tennyson access intersection will, together with any direct flow from Tennyson Street, be substantially collected in drop inlets located in the Tennyson Street/San Antonio Drive intersection. This flow will then be discharged into the Arroyo del Pino via the proposed storm drain. Basin hydrology data and calculations may be found in the Appendix of this report.

LOT DRAINAGE

The lots along Tennyson Street will collect most of their drainage in a 2 ft wide, private V-Notch Ribbon Channel, located along the backyard privacy wall, which will then convey the runoff across property lines into a designated lot containing a Type 'D' drop inlet. The inlet will then convey the runoff to a sidewalk culvert onto Tennyson.

Three residential lots (Lot's 1, 2, 3) in the northeast section of the proposed Basin B will also drain much of their lot drainage (0.938 cfs) to a 2 ft wide, private V-Notch Ribbon Channel located along the backyard privacy wall. The channel will collect the runoff and convey it to the proposed roadway located north of the residential lots in question.

All remaining lots will drain to the street located directly in front of the lot.

STREET CAPACITY

Where shown on the plan, streets will carry flow to the proposed storm drain systems. Mountable curb will be used whenever flows will remain below the top of curb. Standard curb will be used where flows exceed the capacity of mountable curb. Please refer to Table 2 and the enclosed Grading/Drainage Plan.

In accordance with the Ordinance, 10-year event storm flows in Tennyson will remain at or below a depth of 0.5 feet. Storms larger than the 10-year event will be permitted to flow at a depth equal to the top of curb.

Intersections were also analyzed for adverse hydraulic jumps in the flow. All intersections are shown to contain flow within the curbs. Please refer to Table 1 for reference.

PROPOSED STORM DRAIN EXTENSION TO PINO ARROYO

As stated in previous sections, existing undeveloped site drainage flows substantially in a westerly direction, i.e., across Tennyson onto partially developed lands. The southern portion of the site drains directly to the Pino Arroyo. In accordance with County Drainage Ordinance Policy that requires discharge be restricted to meet downstream limitations, a storm drain system is proposed to collect and discharge the bulk of the site flow away from the mostly undeveloped lands west of Tennyson. The storm drain system, involving storm drain pipe sizes of 21", 24" and 42" RCP, will extend in Tennyson from Santa Monica Avenue to San Antonio, then east in an easement to Tramway right-of-way, and then south to the outlet wingwall of the Pino Arroyo/Tramway Crossing structure. Please refer to the enclosed preliminary storm drain plan sheet. The plan identifies the pipe flows and hydraulic grades proposed in the system. Calculations are found in the Appendix of this report. The system will outlet by direct connection to the north concrete wingwall of the Tramway crossing structure (5-10'x10' box culverts) at the Pino Arroyo. Discharge from this structure than drains to the Pino/Tramway dam, west of Tramway Boulevard.

The system alignment using Tramway Boulevard right-of-way, rather than proceeding southerly out of the San Antonio/Tennyson intersection, was selected out of necessity. This necessity arises from the current ownership of the property south of the mentioned intersection. Resolution Trust Corporation (RTC) currently controls this property and has had past drainage difficulties and differences of opinion with the County regarding this area. As no easement currently exists, it is considered improbable that an easement at this time could be obtained from RTC.

The only foreseen difficulty with the selected Tramway alignment is the presence of PNM transmission poles and anchor wires. However, ongoing talks with PNM's Mr. Blake Forbes appear to have solutions available for this difficulty by relocation of the anchors.

The alignment was discussed at the County Review Committee with no adverse comment.

The system was designed for pressure flow since little pipe slope is available. Accordingly, a selection of a beginning water surface elevation at the Pino Arroyo box culvert is necessary. An elevation of 6014 was selected which corresponds to the estimated normal depth of flow in the box culvert during the 100-year storm event, approximately four feet. The selection is considered reasonable and conservative since it is anticipated that the peak flow of the Pino Arroyo drainage basin system will occur significantly after the passage of the peak flow from the Units 21 and 22

storm drain system. The use of the four foot depth also nearly corresponds to the soffit of the 42" pipe exiting at the wingwall of the box culvert.

CONCLUSION

This report has presented a drainage management plan for the proposed Sandia Heights South Unit 21 & 22 Subdivision. The plan provides safe and adequate drainage protection for the proposed development. It is recommended that this plan be approved as requested.

ANALYSIS OF 10 YR-STORM W/ STREET SLOPES ON TENNYSON

PURPOSE IS TO DETERMINE IF THE SLOPES ON TENNYSON WILL CONTAIN THE 10 YR STORM FLOW RATE @ A MAXIMUM HEIGHT NO GREATER THAN 0.5 FT ALONG CURB.

PLATE 22.3 D-3 FROM DPM MANUAL IS USED TO DETERMINE MAXIMUM ½ STREET FLOWS

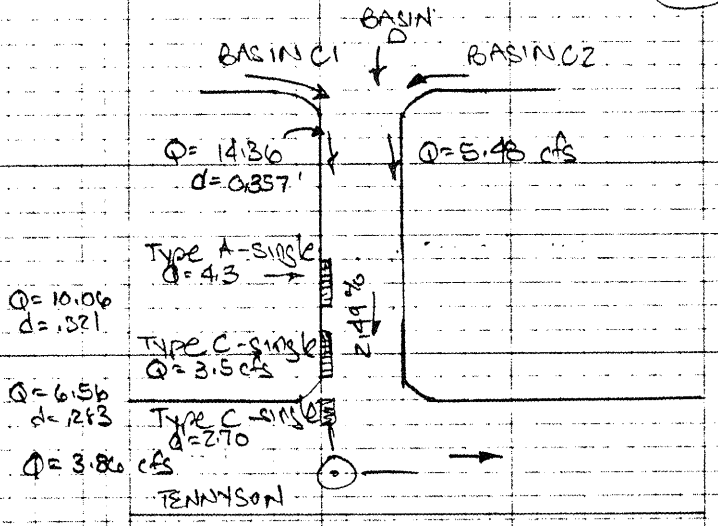
SLOPE = 0.879%

BASINS THAT EFFECT STREET SLOPE: BASIN A, BASIN C, BASIN D, BASIN I, BASIN J, ½ BASIN TENNYSON 3P

FLOW RATE = 8.88 + 7.24 + 3.72 + 0.89 + 0.66 + 1.24 = 22.63 cfs

FROM PLATE 22.3 D-3

½ STREET FLOW = 12.7 cfs < 22.63 (NG) → PROVIDE INLETS



AFTER INLETS

FLOW RATE ON TENNYSON = 3.86 + 5.48 + 0.89 + 0.66 + 1.24 = 12.13 cfs

½ STREET FLOW = 12.7 cfs > 12.13 cfs (OK)

SLOPE = 1.394%

BASINS THAT EFFECT SLOPE = BASIN A, C, D, I, J, ½ TENNYSON 3P, ½ TENNYSON 4P

FLOW RATE = 12.13 + 0.88 = 13.00 cfs

FROM PLATE 22.3 D-3 ½ STREET FLOW = 11.5 cfs > 13 cfs (OK)

SLOPE 3.96%

BASINS THAT EFFECT SLOPE = BASINS A, C, D, I, J, ½ TENNYSON 3P, 4P AND BASIN K

FLOW RATE = 13.00 + .89 = 13.89 cfs
½ STREET FLOW = 27 cfs > 13.89 (OK)

PROJECT NAME _____ SHEET _____ OF _____

PROJECT NO. _____ BY _____ DATE _____

BAKEYARD DRAINAGE INLET DESIGN

BASIN F

TOTAL Area = 0.58 acres

$Q_{100} = 2.60$ cfs

Assume inlet acts as an orifice

Try a single grate type D inlet

There are 96 opening per single grate area

Opening area = $4\frac{1}{2}" \times \frac{25}{16}" = 7.03$ in^2 say 7.00 in^2

96×7.00 in^2/opening = 672 in^2 $\Rightarrow$ 4.67 ft^2 ← orifice area

Assume a 30% clogging factor $4.67(0.7) = 3.27$ ft^2

$Q = CA\sqrt{2gh}$ $C = 0.60$ discharge coefficient

C value determine from Handbook of Hydraulics by King & Brater

solve for h

$2g = 2(32.2) = 64.4$

$h = \left(\frac{Q}{CA}\right)^2 / 64.4$

$h = 0.027$ ft $= 0.33$ in

BASIN G

TOTAL AREA = 0.21 acres

$Q_{100} = 0.93$ cfs

$h = \left(\frac{Q}{CA}\right)^2 / 64.4$

solve for $h = 0.0035$ FT $= 0.04$ in

BASIN H

TOTAL AREA = 0.26 acres

$Q_{100} = 1.16$ cfs

$h = 0.0054$ ft $= 0.07$ inches

BASIN I

TOTAL AREA = 0.31 acres

$Q_{100} = 1.39$ cfs

$h = 0.0078$ ft $\Rightarrow$ 0.094 inches

BOHANNAN-HUSTON INC.

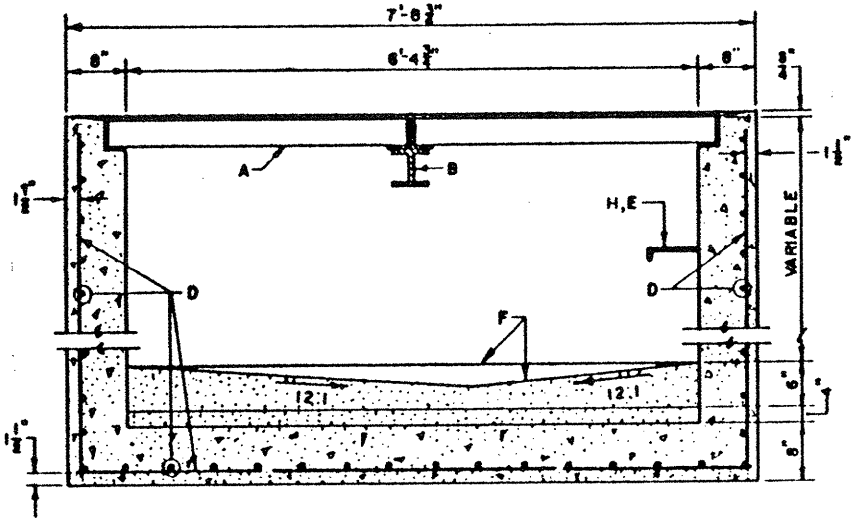
SECTION B-B



SECTION A-A

GENERAL NOTES:

1. FOR SINGLE GRATE TYPE STORM INLET, DELETE CENTER SUPPORT AND MOVE ONE END WALL TO FORM NEW SINGLE GRATE INLET.
2. STORM INLET GUTTER TRANSITION WILL BE SHOWN ON THE CONSTRUCTION PLANS.
3. OUTLET PIPE SIZE, PER DESIGN REQUIREMENT.
4. FOR FRAME & GRATING, SEE DWG 2216, 2220 & 2221.
5. FOR CENTER SUPPORT ASSEMBLY, SEE DWG 2215.

CONSTRUCTION NOTES:

A. FRAME & GRATE

B. CENTER SUPPORT ASSEMBLY.

C. CUT ONE HORIZONTAL AND ONE VERTICAL BAR MAX. AT PIPE OPENING.

D. NO. 4 BARS A 6" O.C. EACH WAY.

E. USE STANDARD STEPS, SEE DWG 2229.

F. CONC. FILL, SEE NOTE C DWG 2201.

G. INVERT PER DESIGN.

H. INSTALL STEPS ON UPSTREAM FACE.

DOWEL DETAIL

GENERAL NOTES:

1. PLACING OF DRAIN THRU EXIST. SIDEWALK AND CURB & GUTTER REQUIRES THAT ENTIRE SIDEWALK AND C & G STONES BE REMOVED AND REPLACED AS DETAILED HEREIN.
2. BOTTOM SLAB OF CULVERT SHALL BE POURED MONOLITHICALLY WITH NEW GUTTER.
3. THE INVERT SHALL BE TROWELED TO PRODUCE A HARD POLISHED SURFACE OF MAX DENSITY AND SMOOTHNESS. INVERT SHALL BE V-SHAPED TO WITHIN 3" OF OUTLET, THEN WARPED TO PARALLEL FLOWLINE AT OUTLET, UNLESS OTHERWISE SHOWN.
4. ALL EXPOSED CONC. SURFACE SHALL MATCH GRADE, COLOR, FINISH AND SCORING OF ADJACENT CURB AND SIDEWALK.
5. SIDEWALK REPLACED DURING CONSTRUCTION SHALL BE POURED MONOLITHICALLY WITH CULVERT WALLS.
6. IF ROD ANCHORS ARE USED, DRILL & TAP FOR F.H. MACHINE SCREW. ATTACH ANCHORS TO PLATE AND SECURE PLATE IN PLACE PRIOR TO POURING OF WALLS.
7. LENGTH OF EACH PLATE SHALL BE SUCH THAT THE WEIGHT WILL NOT EXCEED 300 LBS. AND SHALL BE STRESS RELIEVED AFTER FABRICATION. CLEAN SURFACE OF PLATE AND FRAMING MEMBERS AND PAINT W/ ONE SHOP COAT RED OXIDE AND TWO FINISH COATS ALUMINUM PAINT (AASHTO M 69).
8. THE CITY WILL NOT ASSUME RESPONSIBILITY FOR MAINTENANCE OF ANY SIDEWALK CULVERT INSTALLED BY OR FOR PRIVATE PROPERTY OWNERS.

CONSTRUCTION NOTES:

A. MATCH NEAREST CONTROL JOINT, INSTALL 1/2" EXPANSION JOINT.
B. EDGE OF SIDEWALK OR SETBACK (VARIABLE).
C. 3" RADIUS (TYPICAL).
D. 3/8" CHECKERED STEEL PLATE (PAINT PER NOTE 7, ABOVE).
E. FOR SECURING PLATE USE 1"X 5" S.S. ROD ANCHOR, "RED HEAD MULTI-SET II SRM-38 ANCHOR" OR APPROVED EQUAL. INSTALL PER MANUFACTURER'S INSTRUCTIONS AT MAX. 24" O.C., A MINIMUM OF 2 PER SIDE AND ONE WITHIN 6" OF EACH END.
F. CONSTRUCTION JOINT IS OPTIONAL. IF USED, SPACE DOWELS AT 18" O.C. MAX., 1 1/2" MINIMUM FROM FACE OF CONCRETE.
G. 3/8" - 16 x 1 1/4" COUNTERSUNK, F.H., STAINLESS STEEL, MACHINE SCREW.
H. SLOPE 1/4" PER FT. MIN.
J. DRAIN WIDTH PER PLAN (12" MIN., 24" MAX).

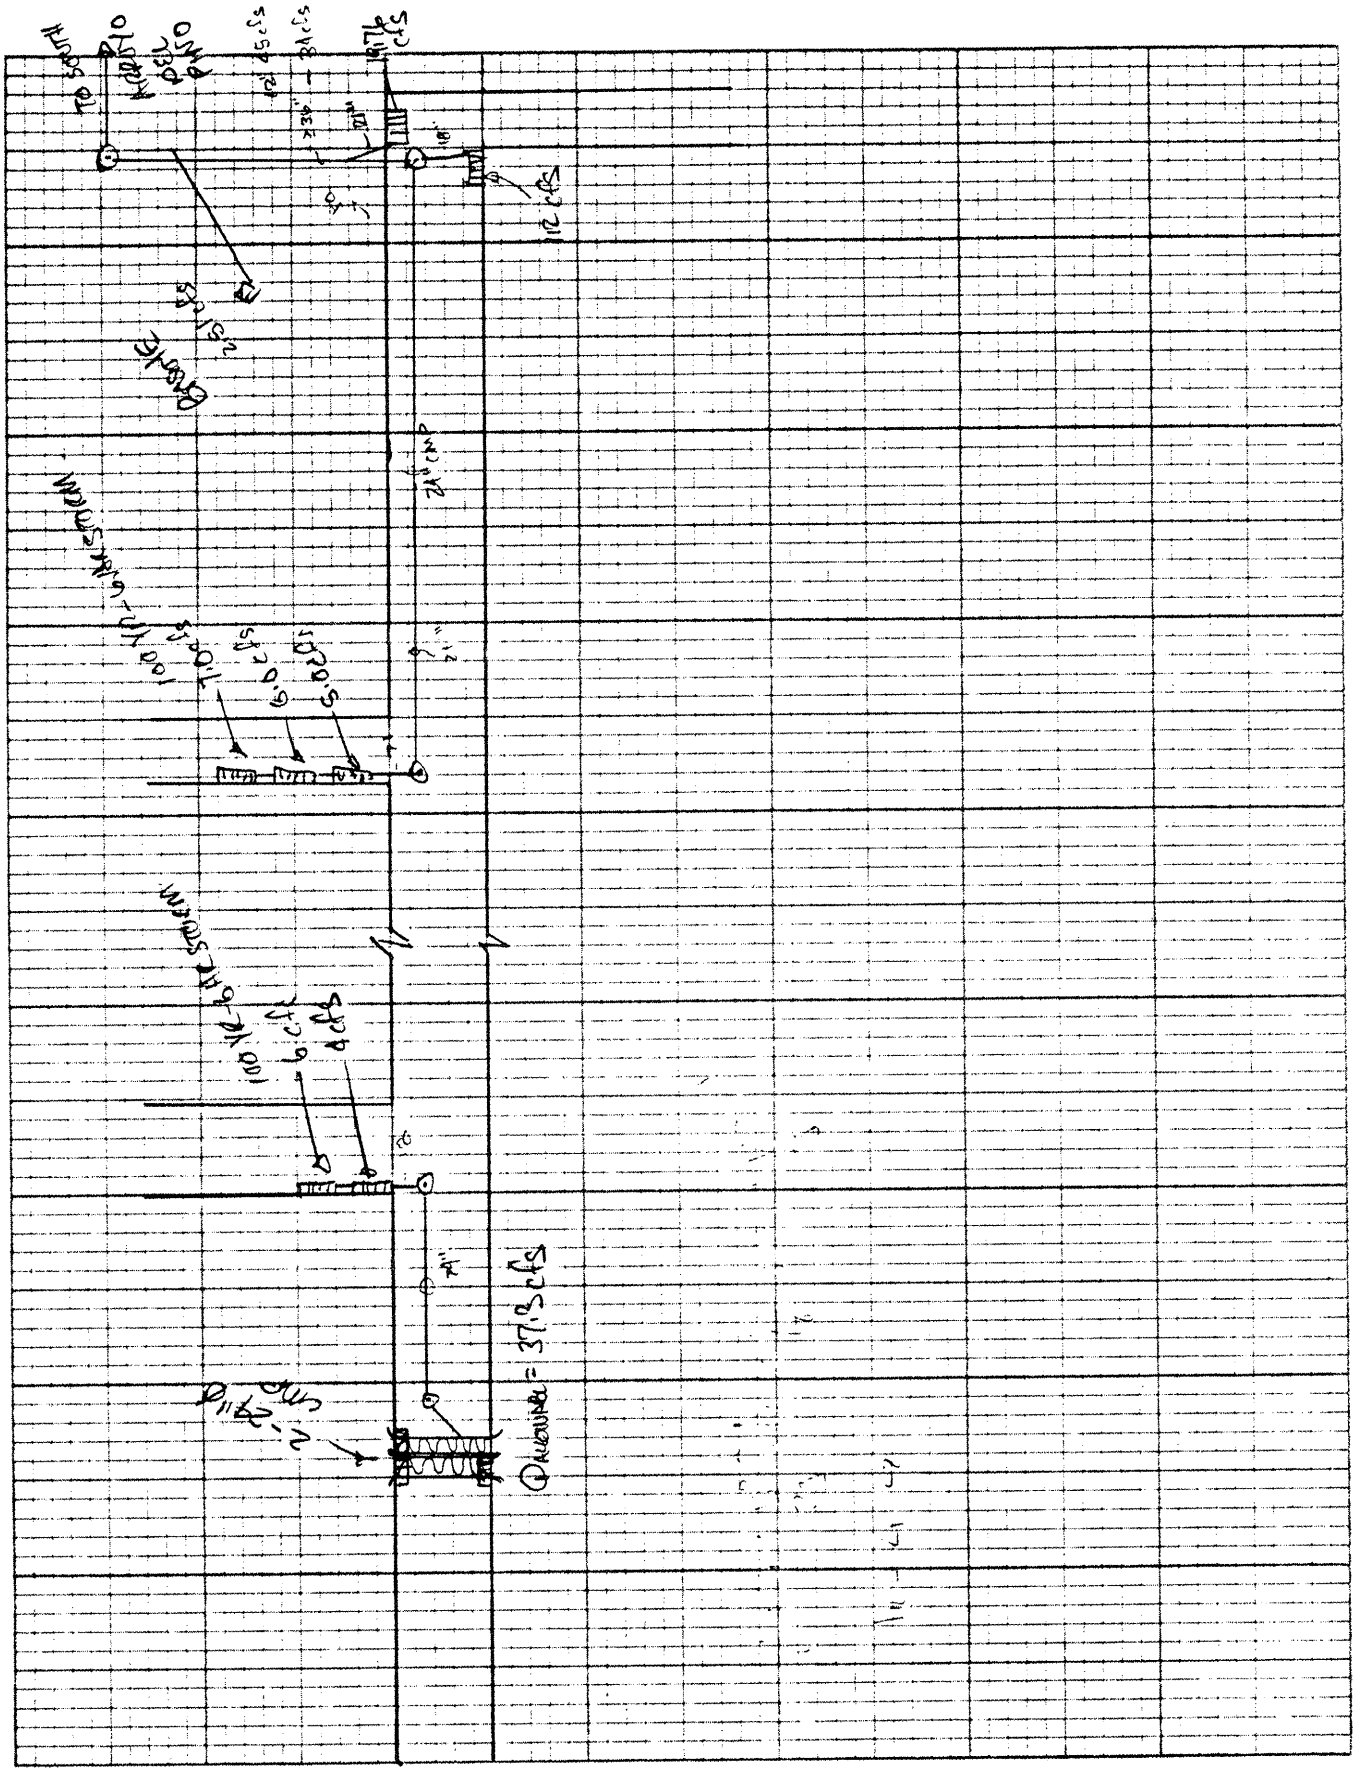
CATCH BASIN DESIGN

STORM DRAIN INLET ANALYSIS
ANALYSIS OF EXISTING 24" CMP CROSSING TENNYSON



BOHANNAN-HUSTON INC.

PROJECT NAME _____ SHEET _____ OF _____

PROJECT NO. _____ BY _____ DATE _____

SUBJECT _____ CH'D _____ DATE _____

BASIN E - INLET DESIGN

TOTAL AREA = 0.56 Acres

Q_{100} = 2.51 cfs

Assume orifice condition

$Q = CA(2gh)^{1/2}$

C - discharge coefficient = 0.60 according King and Brater Handbook of Hydraulics used throughout calculations.

Try one single grate type 'C'

Total Area = $\frac{40" \times 25"}{144}$ = 6.94 ft²

Orifice Area = dia bars$_H$ = ½" & bars are 6" oc => 4.5"

dia bars$_V$ = ½" & bars are 2 1/16" oc => 25/16"

there are 12 x 8 openings = 96 opening

Area of 1 opening = 4.5" x 25/16" = 7.03 in² say 7.00 in²

orifice area = 672 in² => 4.67 ft²

Assume a 30% clogging factor 4.67 (0.7) = 3.27 ft²

solve for h = 0.03 ft < 0.167 OK

< 0.335 OK

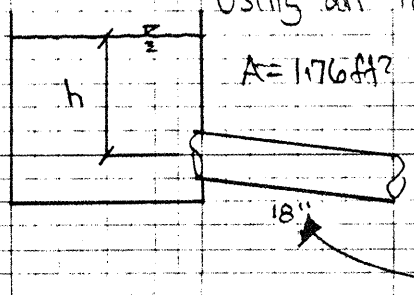
Using an 18" RCP

Q = 2.51

C = 0.6

$A = \frac{\pi D^2}{4}$

g = 32.2 ft/s²



A = 1.176 ft²

Assume Orifice:

$Q = CA(2gh)^{1/2}$

h = 0.09 ft

is not orifice.

(3) - INLET DESIGN - SUMP CONDITION

Assume inlet acts as an orifice

$Q = CA\sqrt{2gh}$

Assume 30% clogging - Double grate

$A = 6.34\ ft^2$ (clogging taken into account)

$C = 0.6$ ← King & Brater

solve for h using a Double Type 'C' inlet

$h = 0.394$ FT < 0.48 FT ← assumed elevation of street crown (2%)

OK

(4) - INLET DESIGN - Q = 3.13 cfs

street slope = 1.49%

depth of income flow = 0.23 ft

Try one single type 'A' - inlet

From Plate 22.3 D-5 D.P.M.

Q in grating = 1.2 cfs

Residual flow = 1.93 cfs

BOHANNAN-HUSTON INC.

PROJECT NAME ______ SHEET ______ OF ______

PROJECT NO. ______ BY ______ DATE ______

SUBJECT ______ CH'D ______ DATE ______

CATCH BASIN DEPTH

③ INLET - SUMP CONDITION

$Q_p = 19.76$ cfs

Assume orifice condition

$Q = CA\sqrt{2gh}$

Try a 27" RCP

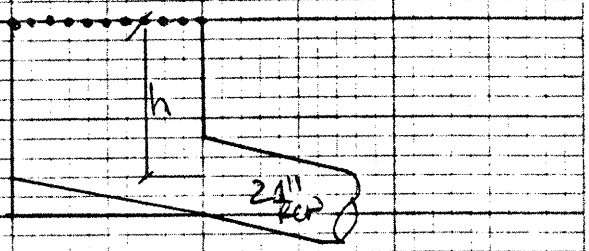
$Q = 19.76$

$C = 0.6$ King & Brater

$A = 3.976$ FT²

solve for h

$h = 1.065$



TRY A 21" RCP

$Q = 19.76$

$A = 2.41$ SF

solve $h = 2.91$ FT

TRY A 24" RCP

$Q = 19.76$ cfs

$A = \pi = 3.14$ SF

$h = 1.71$ FT

Use a 24" Ø RCP

④ INLET -

$Q_p = 1.2$ cfs

Assume orifice condition

$Q = CA\sqrt{2gh}$

Try an 18" RCP

solve for h

$h = 0.02$ FT ~~=~~ does not act as an orifice but controled by gravity flow.

BOHANNAN-HUSTON INC.

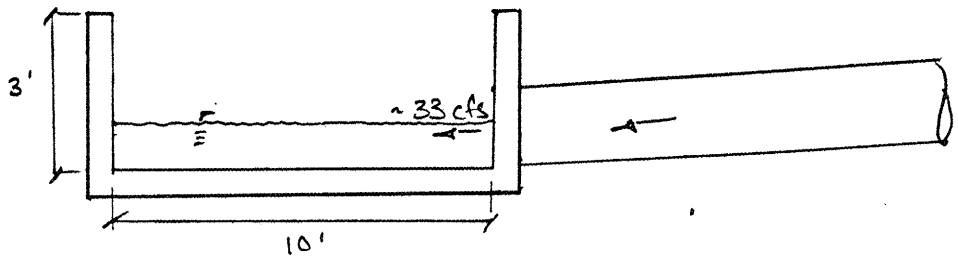
Two 24" ϕ CMP's Discharging A Flow Of ~33 cfs



NOTES:

Total Acreage: - Total subdivision acreage is 13.91 acres.
Total Number of Lots: - 86 Lots (6.18 DU/AC)
Zoning: - Current zoning is SU for Planned C-1 development for Tract 2A of the Lands of Sandia Peak Tram Company and SU for PRD for Tract 1A-1.
Dwelling Units: - All dwelling units shall be single family dwelling units.
Lot Sizes: - Average lot size is 0.101 acres (4400 sq. ft.).
Drainage: - Final drainage plans and improvements must be approved by the County Public Works Department.
Minimum Lot Size: - Minimum lot size shall be 40' wide x 110' deep (approximately).
Setbacks: - Lot setbacks shall be:
Front Yard: 15 feet minimum
Rear Yard: 15 feet minimum
Side Yard: 3 feet minimum one side- 7 feet minimum on opposite side.
Driveway: 18 feet minimum
Corner Lots: 10 feet minimum on street side.
- There will be a distance of not less than 10 feet between all buildings.
Parking: - Off-street parking is provided on each lot for a minimum of 2 cars in addition to 2 parking spaces within each garage.
- Driveway locations may vary depending on housing model constructed and lot selected by buyer.
Roads: - All streets will be public, to be dedicated to the County of Bernalillo for County maintenance.
- No lot shall have direct access to either Tramway Boulevard, San Rafael Avenue or Tennyson Street.
- All streets have centerline radii of 75' minimum.
- All streets meet County Ordinance right-of-way standards with the exception of the 46' wide street adjacent to Tramway Boulevard. The 46' wide street right-of-way width has already been granted a variance by the County Public Works Department. The approval considered the findings that the proposed 46' right-of-way is only 4' less than the standard 50' right-of-way, the street is single-loaded (lots on only one side) and there still remains sufficient width for typical street appurtenances.
- Water services to these properties are to be provided by the Sandia Peak Utility Company.
- Sanitary sewer service to these properties will be provided by Sandia Peak Services, Inc.
Walls and Fences: - Walls/fences shall be constructed on side yard property lines between buildings without obstructing drainage.
- A 5'high (max.) privacy wall will be constructed around the perimeter of the subdivision with the possible exception of a portion of the east property line adjacent to Tramway (across from Lots 1-11, 27). An option to not construct a privacy wall along this reach is retained by the owner.
- Retaining walls, maximum 4' in height, may be required in the final grading plan.
Grading: - Final height and length will be determined at final grading plan.
Building Height: - Lot lines and street alignments on this site plan are approximate and may vary slightly from final plat. Refer to the final plat for actual dimensions.
Sidewalks: - No structure shall exceed 26 feet in height.
- 4' wide sidewalks shall be constructed within this subdivision at the back of curb, except on the east side of the street fronting Lots 1-11,27.
Grading: - Final grades for building pads will be determined on the final grading plan.
