Traffic Impact Study (TIS)
QT #7001 Unser Los Volcanes

Draft Report

June 2024

Prepared for:
QuikTrip Corporation

Prepared By:

EXECUTIVE SUMMARY

The following contains a Traffic Impact Study (TIS) for a QuikTrip travel center to be developed on the corner of Unser Boulevard and Los Volcanes Road in Albuquerque, New Mexico. Lee Engineering has completed this report for QuikTrip Corporation. All analyses and items contained herein conform to scoping requirements set forth in a scoping meeting held on March 26th, 2024, with QuikTrip Corporation, the City of Albuquerque (CABQ), and the New Mexico Department of Transportation (NMDOT).

BACKGROUND

The proposed development is to construct a travel center on the southwest corner of Unser Boulevard and Los Volcanes Road. The site, which is to include a 7,318 square-foot building, 63 parking spaces, and 22 fuel pumps, is anticipated to generate 128 ingress and 128 egress trips during the AM peak hour, and 160 ingress trips and 162 egress trips during the PM peak hour. The site is also expected to generate 53 ingress and 53 egress pass-by trips during the AM peak hour and 66 ingress and 66 egress pass-by trips during the PM peak hour. The number of vehicle trips generated by the proposed development was based on the trip generation rates and equations provided in the Trip Generation Manual, 11th Edition, by the Institute of Transportation Engineers (ITE) 944 – Gasoline/Service Station and 950 – Truck Stop.

Site access is to be provided via a one site access driveway along Los Volcanes Road, one site-access driveway along Unser Boulevard, and one site access driveway along Saul Bell Road. Access points are shown in Figure 1.

Study intersections include:

- 1) I-40 EB Off-Ramp and Unser Boulevard
- 2) Unser Boulevard and Los Volcanes Road
- 3) Saul Bell Road and Unser Boulevard
- 4) Bluewater Road and Oliver Ross Road
- 5) Los Volcanes Road and Site Access 1
- 6) Unser Boulevard and Site Access 2
- 7) Saul Bell Road and Site Access 3

For the purposes of this analysis, the development is assumed to reach full completion by 2026. The development is to be constructed in one phase.

Analysis scenarios for this study include:

- Existing 2024 – Existing traffic volumes
- Build-Out Year 2026 Background – 2026 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model.
- Build-Out Year 2026 Total – 2026 background volumes plus trips generated by the proposed development.
- Horizon Year 2036 Background – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model.
- Horizon Year 2036 Total – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model, plus trips generated by the proposed development.

Existing turning movement counts were collected on April 10th, 2024, for the following study intersections:

- I-40 EB Off-Ramp and Unser Boulevard
- Unser Boulevard and Los Volcanes Road
- Saul Bell Road and Unser Boulevard
- Bluewater Road and Oliver Ross Road

These volumes were analyzed unaltered in the Existing scenario of the Level of Service and Queueing Analysis section. Volumes for the proposed driveways were balanced using existing counts from surrounding intersections. Site trips for the development site were generated based on ITE 944 – Gasoline/Service Station and ITE 950 – Truck Stop, Peak Hour Generator. Proposed development-generated trips were used to analyze Build-Out Year and Horizon Year Total volumes.

SUMMARY OF TRAFFIC ANALYSIS AND RECOMMENDATIONS

The following presents a summary of the traffic analysis and recommendations included in this report.

CONCLUSIONS

Traffic operation conclusions for the intersection of Unser Boulevard and Los Volcanes Road are summarized as follows:

- NBL operates at LOS E during the AM and PM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, Horizon Full Build, Build Out Full Build Mitigated, and Horizon Build Out Mitigated scenarios.
 - This failure is attributed to signal delay as the movement volume is low and the V/C ratio for this movement is less than one for all scenarios. Therefore, no recommendations are made to mitigate this movement.
- SBL operates at LOS F during the AM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, and Horizon Full Build scenarios.
 - Queue storage for this movement is expected to be exceeded.
- SBL operates at LOS E during the PM peak hours for the Existing Year scenario.
- WBR operates at LOS E during the AM peak hour for the Horizon Background and Horizon Full Build scenarios.
- WBR operates at LOS E during the PM peak hour for the Existing Year and Horizon Background scenarios.
- All other movements operate at acceptable levels of service (LOS) and have adequate storage to accommodate the 95th percentile queue lengths under analyzed scenarios.

Traffic operation conclusions for the intersection of I-40 EB Off-Ramp and Unser Boulevard are summarized as follows:

- All movements with HCM results are expected to experience unacceptable delays during the AM and PM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, and Horizon Full Build scenarios.
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM and PM peak hours.
- All other movements operate at acceptable levels of service (LOS) and have adequate storage to accommodate the 95th percentile queue lengths under Existing Year conditions.

SITE RECOMMENDATIONS

Recommendations for study intersections directly serving and primarily impacted by the proposed development are provided as follows:

- Proposed Access Points and Locations:
 - It is recommended that three access points be constructed to provide adequate site circulation for ingress and egress trips as well as truck flow. A full-access configuration for Site Driveway 1, shown on the north end of the site, will provide adequate access for tanker trucks and trash pick-up. The two additional site driveways, one to the east and one to the south, will provide adequate access for passenger vehicles without creating conflicts with articulated trucks on the north end of the site. Driveway 3 will also provide adequate access for trucks.
 - The north Site Driveway 1 is recommended to be full access.
 - The east Site Driveway 2 is recommended to be partial access.
 - The south Site Driveway 3 is recommended to be full access.
- Unser Boulevard and east Site Driveway 2
 - When the intersection is constructed, a southbound right-turn deceleration lane is recommended on the southbound approach. The lane should be constructed as long as possible without encroaching on the existing intersection to the north.
- Unser Boulevard and Saul Bell Road / Site Driveway 3
 - Upon opening of the development, a northbound left-turn deceleration lane is recommended on the northbound approach, making this a partial access intersection. The lane should be constructed to store 50FT of vehicles with lane transition of 600 to 300 FT reverse curve.
 - It is also recommended that a curb and gutter be constructed along the median of Unser Boulevard between Los Volcanes and Bluewater.
 - Note: The MRCOG RACC includes provisions for a northbound left turn lane onto Saul Bell Road from Unser Boulevard. See Figure 13 for additional details.

OFF-SITE INTERSECTION RECOMMENDATIONS

Recommendations for intersections within the study area that do not directly serve the proposed development and are impacted by multiple developments in the area are provided as follows:

- Unser Boulevard and Los Volcanes Road
 - It is recommended that this signal be retimed by a Licensed Professional Traffic Operations Engineer (PTOE) to resolve capacity and queuing issues at this intersection. It is recommended that retiming be performed at or after opening day.
- I-40 EB Off-Ramp and Unser Boulevard
 - For all scenarios, the eastbound left and eastbound right are expected to experience unacceptable delays and queuing. While signalization of the intersection is shown to resolve these issues, it is recommended that an interchange study be conducted to determine an appropriate long-term future configuration for this. The interchange study should be conducted as part of a regional planning effort with multi-jurisdictional involvement, the scope of which is outside the purposes of this development traffic study.

INTRODUCTION

This report details the procedures and findings of a Traffic Impact Study (TIS) performed by Lee Engineering for QuikTrip Corporation. This report and the analyses herein were performed for a travel center development to be constructed on the corner of Unser Boulevard and Los Volcanes Road in Albuquerque, New Mexico. This study examines the impacts of the proposed development on surrounding traffic conditions and discusses the potential impacts of trips generated by the development on the study intersections.

The scope of this report and the analyses performed were completed in agreement with the scoping requirements set forth by the City of Albuquerque (CABQ) and the New Mexico Department of Transportation (NMDOT). Scoping meeting notes from the scoping meeting held on March 26th, 2024, are included in Appendix A. Analysis procedures, conclusions, and recommendations for this study were developed according to the *Highway Capacity Manual (HCM) 6th Edition* and the *Manual on Uniform Traffic Control Devices (MUTCD) 2009 Edition*.

For the purposes of this analysis, the development is assumed to be completed in one phase and to reach full completion by 2026. The site plan displayed in Figure 1 shows that the proposed development is a travel center. Traffic generated by the site is anticipated to be 128 ingress and 128 egress trips during the AM peak hour, 160 ingress trips, and 162 egress trips during the PM peak hour. Figure 2 shows the site plan for the development. Lee Engineering conducted a Level of Service and Queuing Analysis for the following AM and PM peak hour scenarios:

Traffic Analysis

- Existing 2024 – Existing traffic volumes
- Build-Out Year 2026 Background – 2026 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model.
- Build-Out Year 2026 Total – 2026 background volumes plus trips generated by the proposed development.
- Horizon Year 2036 Background – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model.
- Horizon Year 2036 Total – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model, plus trips generated by the proposed development.

The Level of Service and Queuing Analysis Reports are presented in full in the Appendix.

BACKGROUND INFORMATION

PROJECT LOCATION & SITE PLAN

The travel center development will be located on Unser Boulevard, south of Los Volcanes Road. Figure 1 shows the proposed site plan and Figure 2 shows the site location, study intersections, and the surrounding area. Nearby intersections include the following:

- 1) I-40 EB Off-Ramp and Unser Boulevard
- 2) Unser Boulevard and Los Volcanes Road
- 3) Saul Bell Road and Unser Boulevard
- 4) Bluewater Road and Oliver Ross Road
- 5) Los Volcanes Road and Site Access 1

- 6) Unser Boulevard and Site Access 2
- 7) Saul Bell Road and Site Access 3

The proposed development would convert approximately 5 acres of land into a convenience store and gas station. For the purposes of this analysis, the development is anticipated to include a 7,318-square-foot convenience store, 22 fuel pumps, and 51 parking spaces. Proposed access points include one driveway on Los Volcanes Road, one driveway on Unser Boulevard, and one driveway on Saul Bell Road. The development Site Plan is presented in Figure 1, and the Vicinity Map, which includes the study area and intersections, is presented in Figure 2.

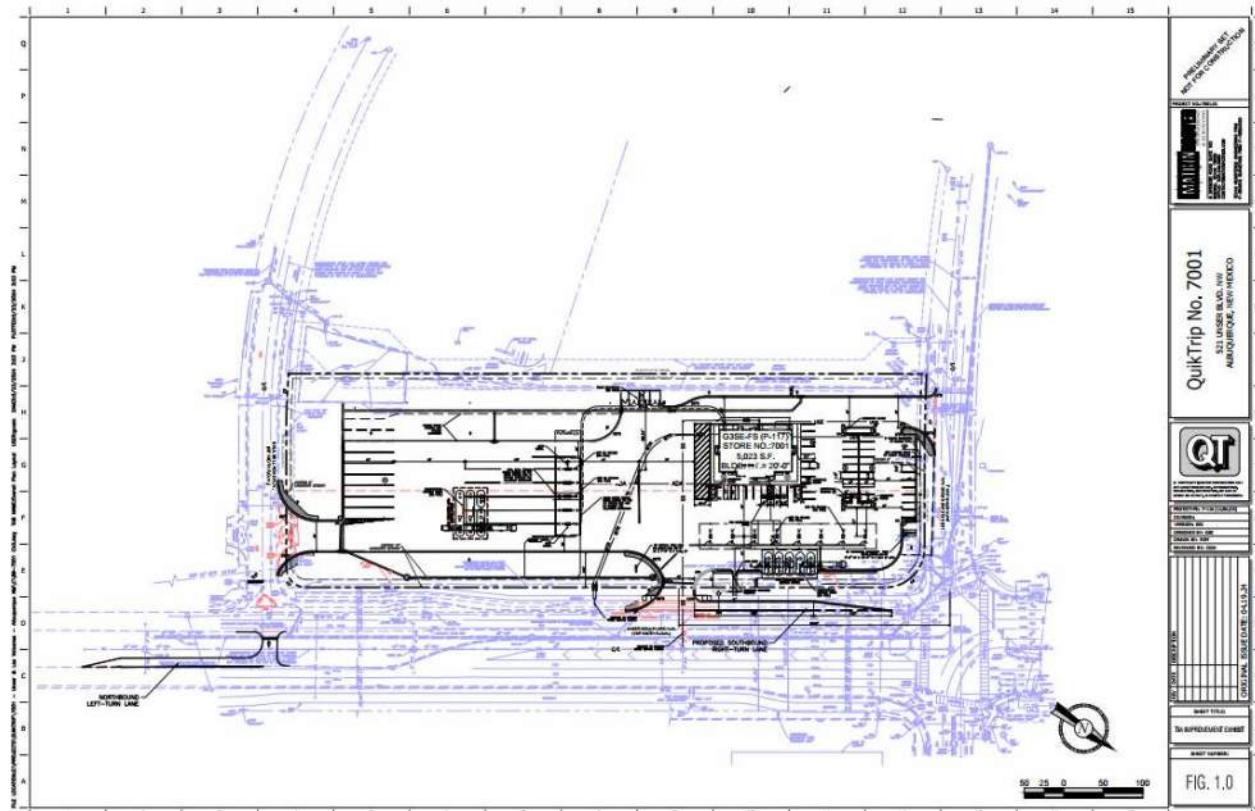

Figure 1: Site Plan

Figure 2: Vicinity Map

STUDY AREA, AREA LAND USE, AND STREETS NARRATIVE SUMMARY

STUDY AREA

The study area is defined as the area just south of Unser Boulevard and Los Volcanes Road intersection. The following intersections were identified for analysis during the scoping meeting:

- 1) I-40 EB Off-Ramp and Unser Boulevard
- 2) Unser Boulevard and Los Volcanes Road
- 3) Saul Bell Road and Unser Boulevard
- 4) Bluewater Road and Oliver Ross Road
- 5) Los Volcanes Road and Site Access 1
- 6) Unser Boulevard and Site Access 2
- 7) Saul Bell Road and Site Access 3

AREA LAND USE

As described, the development is to be located on the southwest corner of Unser Boulevard and Los Volcanes Road. The study area is an urban, largely developed area west of Albuquerque, NM. Adjacent to and surrounding the project site are land uses consisting of the following:

- Commercial: Much of the land to the east of the proposed development is commercial.
- Residential: Much of the land to the west and southwest of the proposed development is single-family residential.
- Undeveloped: Much of the land to the north of the site, southwest and southeast of the I-40 EB-Off Ramp, is currently undeveloped.

STREETS

The following details the characteristics and features of streets included in the study area:

Unser Boulevard is a CABQ-maintained, four-lane, divided roadway that runs north and south. The roadway is classified by MRCOG as a regional principal arterial, and the posted speed limit is 45 MPH. There are two 10-foot travel lanes in each direction. Six-foot sidewalks are present on each side of the roadway. No bicycle facilities are present.

Los Volcanes Road is a CABQ-maintained, four-lane, divided roadway that runs east and west. The roadway is classified by MRCOG as a major collector, and the posted speed limit is 35 MPH. There are two 11-foot travel lanes in each direction with a 13-foot two-way left turn lane. Six-foot sidewalks are present on each side of the roadway. Six-foot bike lanes are present on each side of the roadway.

Saul Bell Road is a CABQ-maintained, undivided local roadway that runs east and west with an assumed speed limit of 25 MPH. It is classified by CABQ as a local urban street. The roadway is 36 feet wide, with five-foot sidewalks present on each side. No bicycle facilities are present.

Oliver Ross Road is a CABQ-maintained, undivided local roadway that runs east and west with an assumed speed limit of 25 MPH. It is classified by CABQ as a local urban street. The roadway is 36 feet wide, with five-foot sidewalks present on each side. No bicycle facilities are present.

Bluewater Road is a CABQ-maintained, two-lane, divided roadway that runs east and west. The roadway is classified by MRCOG as a major collector, and the posted speed limit is 40 MPH. There is one 12-foot travel lane with a 5-foot shoulder in each direction and a 13-foot two-way left turn lane. Six-foot sidewalks are present on each side of the roadway. No bicycle facilities are present.

I-40 EB Off-Ramp is an NMDOT-maintained, one-lane, one-way roadway that provides access to I-40. The roadway is classified by NMDOT as an interstate, and the assumed speed limit is 40 MPH. There is one 18-foot travel lane. No pedestrian or bicycle facilities are present.

INTERSECTIONS

The following details the traffic control and characteristics of the existing intersections in the study area:

I-40 EB Off-Ramp and Unser Boulevard is a 3-legged, one-way unsignalized intersection. It consists of two through lanes and a dedicated right-turn lane that merges onto the I-40 interstate. No pedestrian or bicycle facilities are present at this intersection.

Unser Boulevard and Los Volcanes Road is a 4-legged, signalized intersection. The east leg comprises a left-turn lane, a through lane and a right-turn lane. The west leg comprises a left-turn lane and a shared through/right-turn lane. The north leg comprises two left-turn lanes, two through lanes, and a right-turn lane. The south leg comprises a left-turn lane, three through lanes, and a right-turn lane. Sidewalks are present in every direction, and all crosswalk locations include pedestrian signals and curb ramps. The north and south legs of the intersection consist of protected-only left turn phasing, while the east and west legs consist of protected/permissive left turn phasing. Vehicle detection is present in every direction.

Unser Boulevard and Saul Bell Road is a 3-legged, stop-controlled intersection. The west leg comprises a shared left-turn/through lane. The south leg comprises two through lanes and a right-turn lane. Sidewalks are present on the north, south, and west legs of the intersection. No crosswalks are present.

Bluewater and Oliver Ross Road is a 4-legged, stop-controlled intersection. The east and west legs comprise a shared through/right-turn lane and a left-turn lane. The north and south legs comprise a shared left-turn/through/right-turn lane. Sidewalks are present in every direction. No crosswalks are present. Bicycle lanes are present on Bluewater Road.

BICYCLE FACILITIES

Currently, Bicycle lanes are present on Los Volcanes Road, east of Unser Boulevard. Bicycle lanes are not present within the study area along any other roadway. However, a large multi-use trail abuts Unser Boulevard to the east.

ADJACENT DEVELOPMENTS

Two adjacent developments are under review near the study area, one located at the Unser Boulevard and Bluewater Road intersection, and another located east of Unser Boulevard across from Saul Bell Road. Per the scoping meeting, traffic studies were not required for these developments. Therefore, no specific considerations were made in this report for this development. Rather, MRCOG growth projections were used to analyze background growth for future scenarios.

DATA COLLECTION

The following section details the data collection method used in subsequent analyses of this report. The data discussed below was collected via a combination of field observations and machine/video recordings.

FIELD DATA COLLECTION

On-Street Parking

No dedicated on-street space is provided in the study area.

Pedestrians and Bicycles

Pedestrian and bicycle volumes were collected at all study intersections with turning movement counts (see Turning Movement Counts section below). Pedestrian and bicycle hourly volumes are provided in Appendix B.

Transit

According to the City of Albuquerque's ABQ Ride System Map (2023), no bus routes pass through the study area.

Signal Timings

The City of Albuquerque Traffic Engineering Division provided signal timing for the signalized intersection of Unser Boulevard and Los Volcanes Road. Signal timing sheets used in the capacity analyses are provided in Appendix C.

TRAFFIC SCENARIO DEVELOPMENT

The following sections detail the methods and calculations used to obtain traffic volumes for the existing 2026 and 2036 analysis scenarios. This process used the following tools as described below: Traffic Projections, Site Trip Generation, and Trip Distribution and Assignment. Figures at the end of this section show the resulting traffic volumes determined for the 2026 and 2036 analysis scenarios.

TRAFFIC COUNTS, GROWTH RATES, AND TRIP GENERATIONS

TURNING MOVEMENT COUNTS

Turning movement counts (TMC) were collected for nine hours in three periods: 6:00 AM-9:00 AM, 11:00 AM-2:00 PM, and 3:30 PM-6:30 PM on Wednesday, April 10th, 2024, for four of the study intersections. Turning movement volumes collected at the study intersections show a typical commuter directionally biased distribution with observable AM and PM peak hour periods. Table 1 shows the observed peak hours for each intersection where traffic counts were collected and the peak hours for the entire study area (network peak). AM and PM peak-hour traffic volumes are shown in Figure 3. Complete turning movement counts can be found in Appendix B. Through movement traffic volumes for the proposed driveways were assumed based on existing volumes for the surrounding driveways.

Table 1: Intersection and Network Peak Hours

Intersection	AM Peak Hour	PM Peak Hour
I-40 EB Off-Ramp and Unser Boulevard	7:30 AM	3:45 PM
Unser Boulevard and Los Volcanes Road	7:45 AM	3:45 PM
Saul Bell Road and Unser Boulevard	7:15 AM	4:15 PM
Bluewater Road and Oliver Ross Road	8:00 AM	3:45 PM
Network Peak Hours:	7:30 AM	3:45 PM

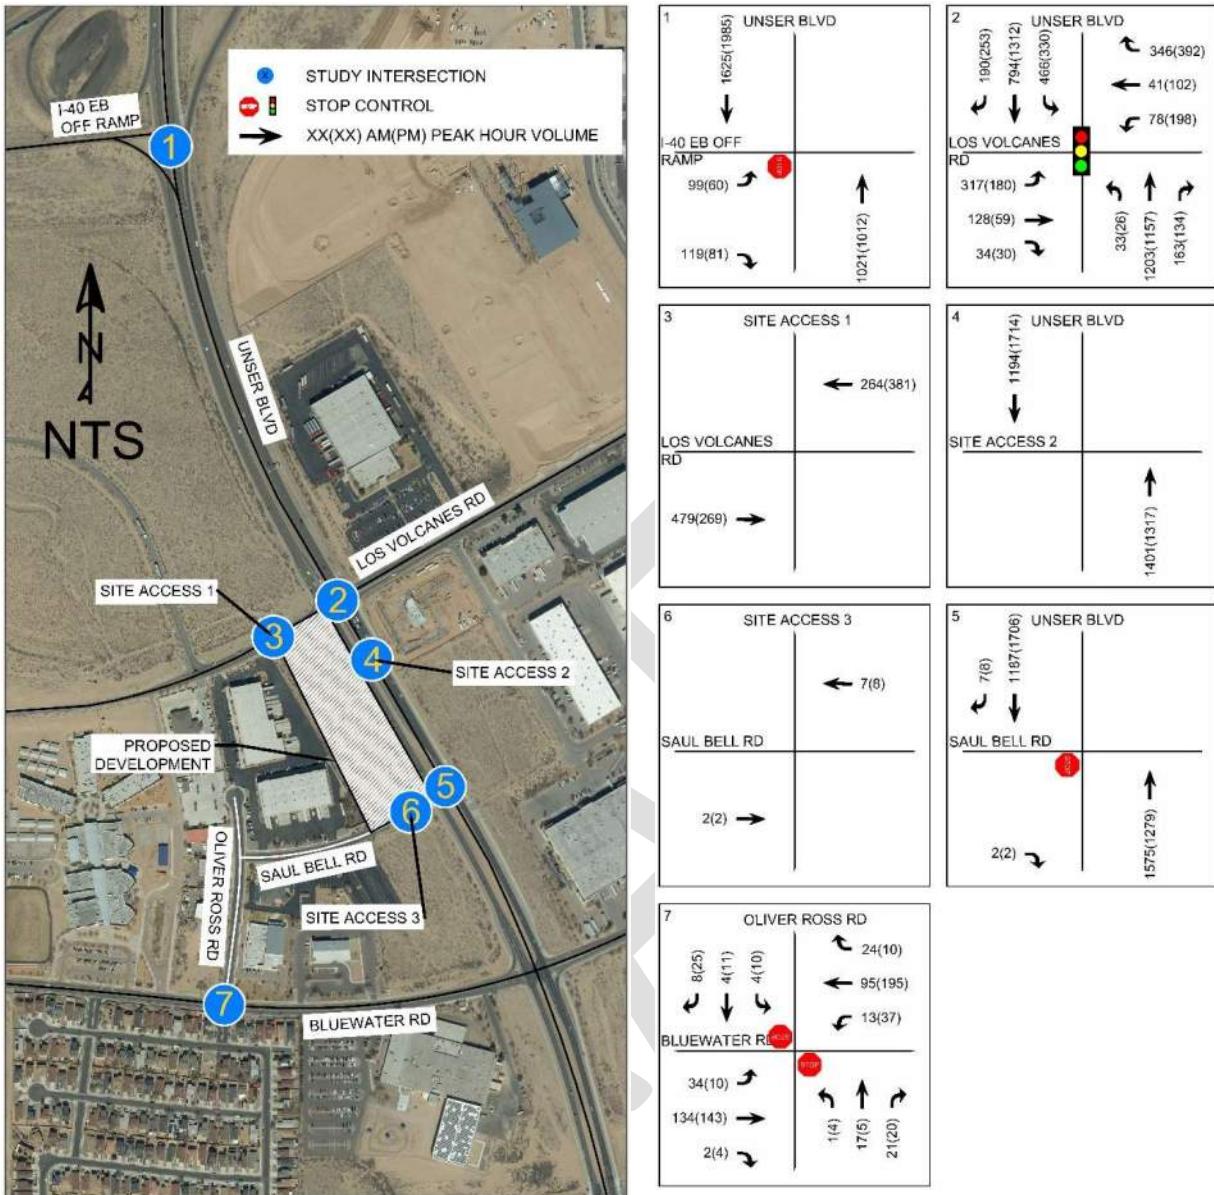

Figure 3: Existing Peak Hour Turning Movement Counts

TRAFFIC GROWTH

For the purposes of this analysis, the future year volumes were forecast from existing traffic volumes using values from 2016 and 2040 (updated) travel demand models provided by MRCOG. These models were then compared using AM and PM peak hour direction volumes (AMPH LOAD and PMPH LOAD) to calculate anticipated growth rates for individual roadways near the study area. Roadways calculated to have a yearly growth rate of less than 1% were analyzed with a 1% per year growth rate to facilitate a conservative analysis. Growth rates were then converted to growth factors for specific analysis scenarios. Values provided by MRCOG are reproduced verbatim in Table 2, in addition to the calculated growth rates used in the analysis. Growth rates were then applied to the 2024 existing volumes to forecast future volumes. Projected turning movement volumes were used along with adjacent developments' site-generated trips for the Build-Out Year 2026 Background scenario. 2026 Background volumes plus the proposed development's site-generated trips were used for the Build-Out Year 2026 Full-Build scenario.

Table 2: Yearly Growth Rates

Roadway		MRCOG 2016 Model "Peak Hour Load"	MRCOG 2040 Model "Peak Hour Load"	Yearly Growth Rate	Average Area Yearly Growth	Growth Rate for Analysis
I-40 EB Off Ramp/ Unser Blvd	West Leg	AM PH 140	491	5.37%	0.61%	1.00%
		PM PH 230	384	2.16%		
	North Leg	AM PH 1296	1466	0.51%

		PM PH 95	141	1.66%		
	East Leg	AM PH 73	185	3.95%		
		PM PH 219	460	3.14%		

Source: MRCOG 2016 and 2040 Models

SITE TRIP GENERATION

Trip generation for the Proposed Development was performed using the procedures and methodologies provided in the ITE Trip Generation Manual, 11th Edition. The land use categories Gasoline/Service Station (ITE 944) and Truck Stop (ITE 950) were used to generate trips for the Development. Trips were calculated using the rate for Weekday AM and PM Peak Hour Traffic. Trips generated by the proposed development are shown in the tables below. Site-generated trips were added to the Background traffic volumes to create the Total Build-Out and Horizon Year traffic volumes. Table 3 below shows the trip generation volumes and percents.

Table 3: Proposed Development Trip Generation

Use	Units		Weekday AM Peak Hour					Weekday PM Peak Hour					
			Total	Enter	Exit	In	Out	Total	Enter	Exit	In	Out	
ITE 944 – Gasoline/Service Station	16	VFP	168	50%	50%	84	84	231	50%	50%	115	116	
ITE 944 – Gasoline/Service Station (Pass-By)	16	VFP	106	50%	50%	53	53	132	50%	50%	66	66	
ITE 950 – Truck Stop	6	VFP	88	51%	49%	45	43	91	50%	50%	46	45	
				Total Trips			129	127	Total Trips			161	161

Trip Distribution and Assignment

The proposed site-generated trip distribution was determined based on the analysis of existing intersection demand characteristics within the study area. These direct trips were routed within the roadway network to and from the Development based on the proportions of existing turning movement counts during the AM and PM peak hours. Figures 4 through 8 show the routing percentages and trips generated by the development.

TRAFFIC VOLUME CALCULATIONS

Traffic volumes used in the Build-Out Year and Horizon Year analyses were calculated as follows:

- Build-Out Year 2026 Background – 2026 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model
- Build-Out Year 2026 Total – 2026 background volumes plus trips generated by the proposed development
- Horizon Year 2036 Background – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model
- Horizon Year 2036 Total – 2036 traffic volumes projected from the Existing traffic volumes via the application of a growth factor developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model, plus trips generated by the proposed development

Figures 9 through 12 show the volumes for each Build-Out and Horizon Year scenario.

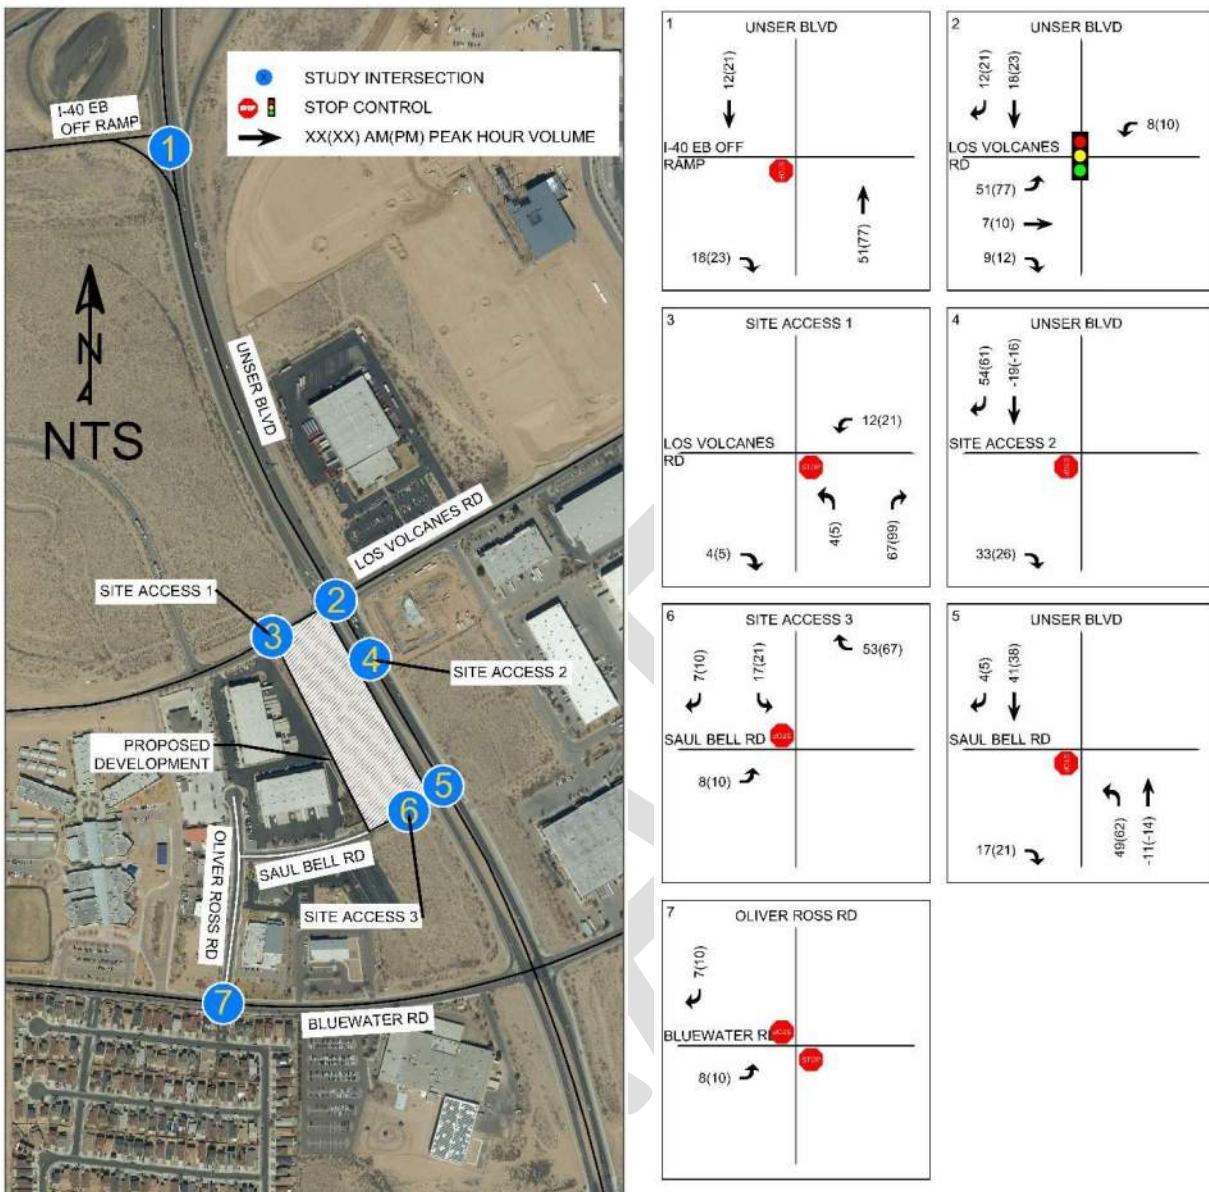

Figure 8: Site Generated Total Trips

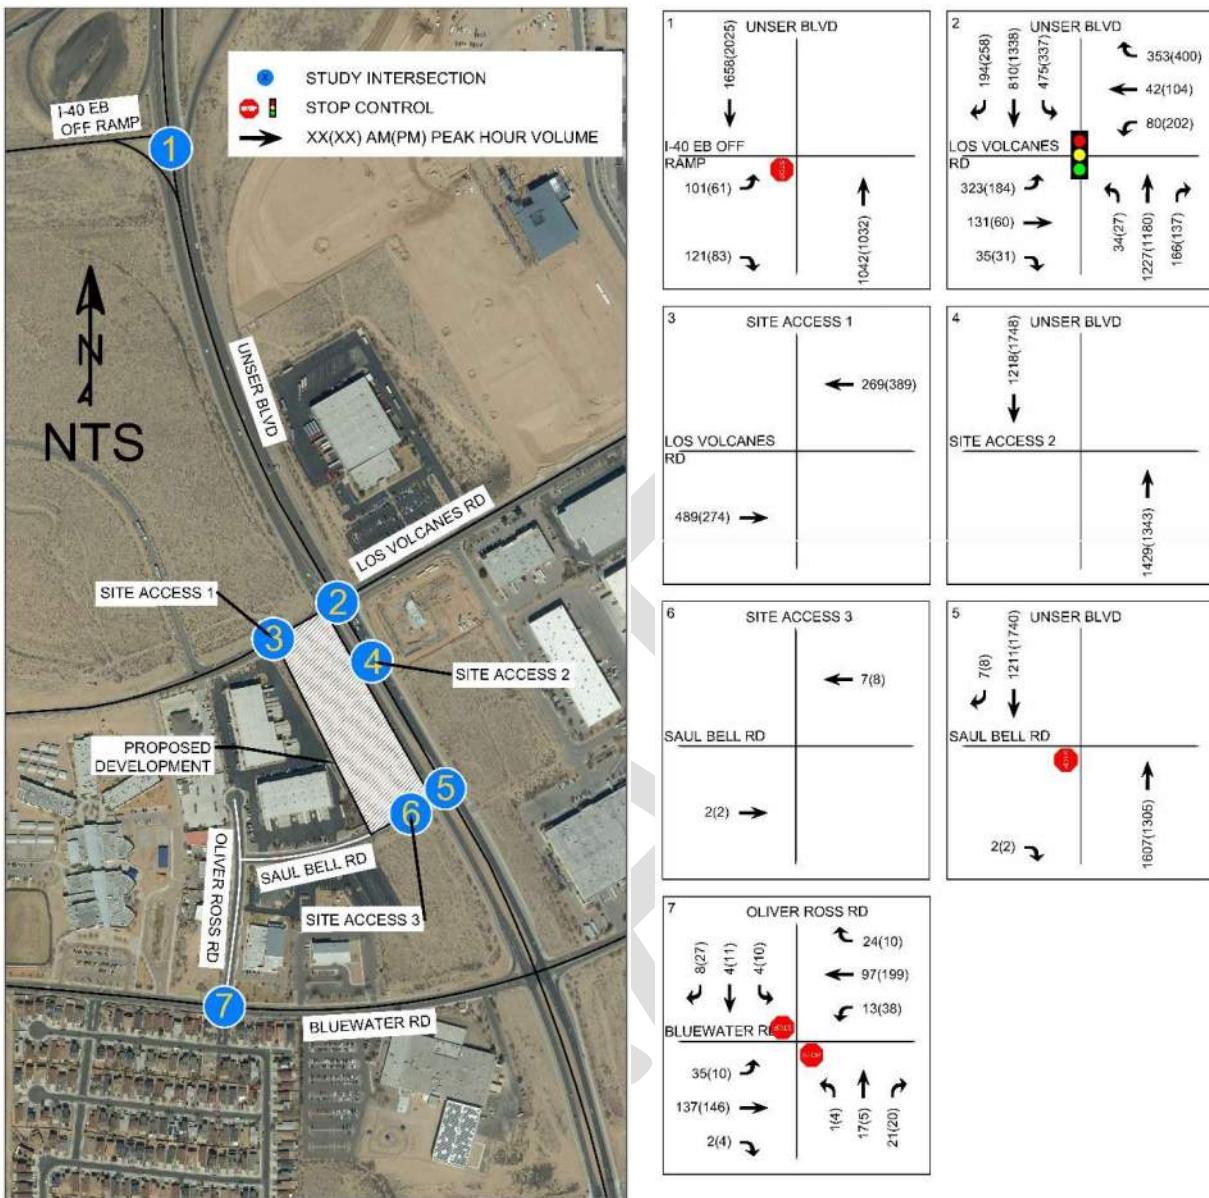

Figure 9: Build-Out Year 2026 Background Volumes

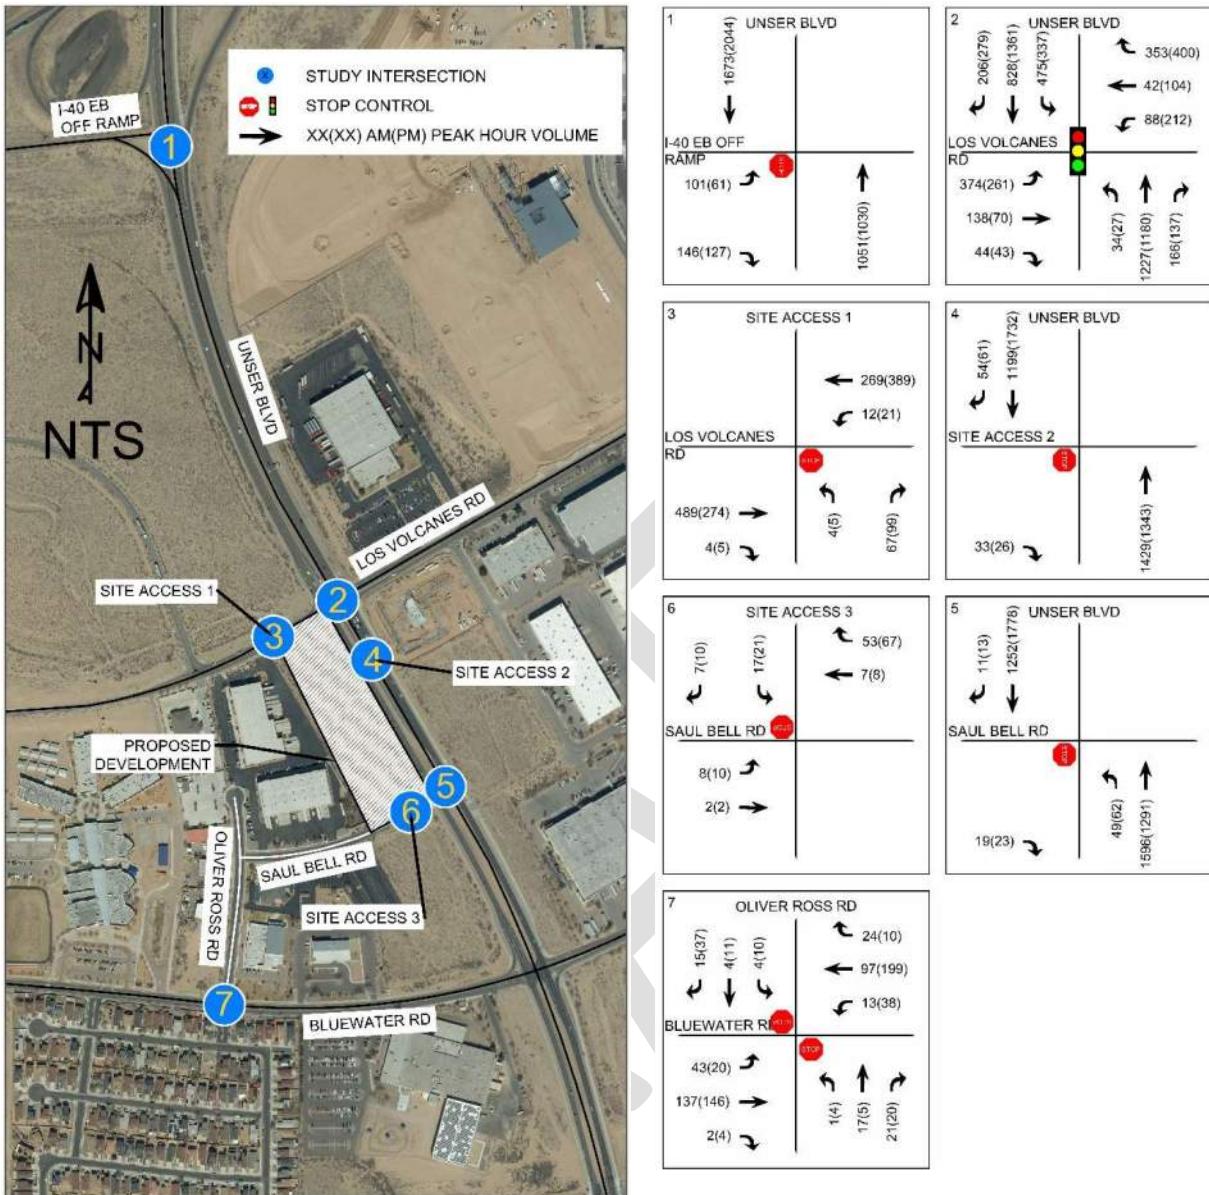

Figure 10: Build-Out Year 2026 Full-Build Volumes

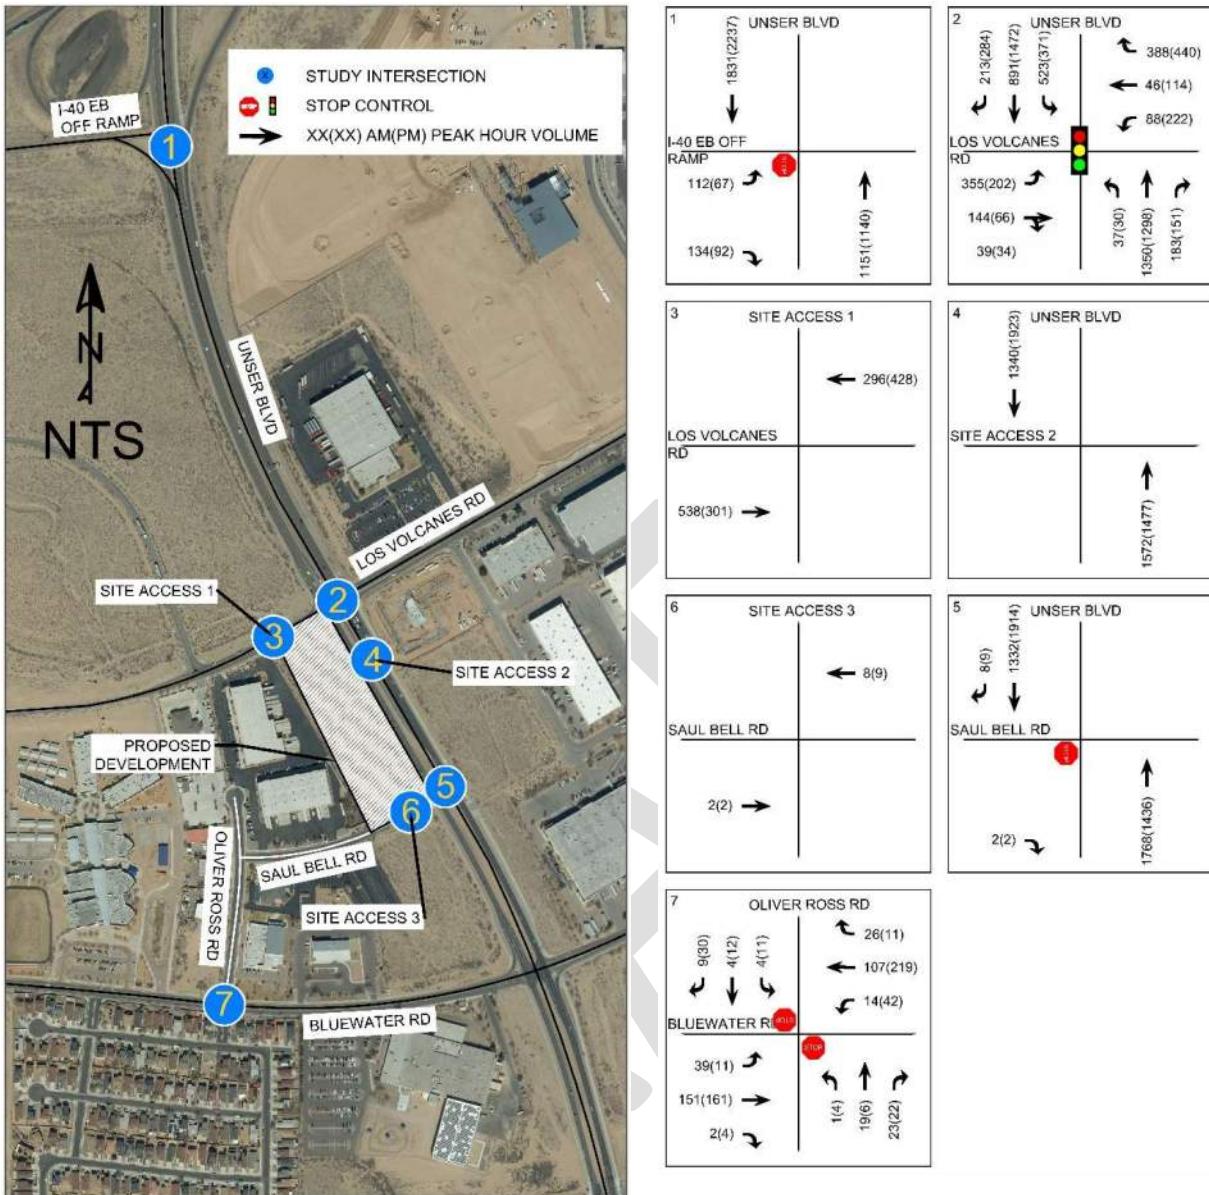

Figure 11: Horizon Year 2036 Background Volumes

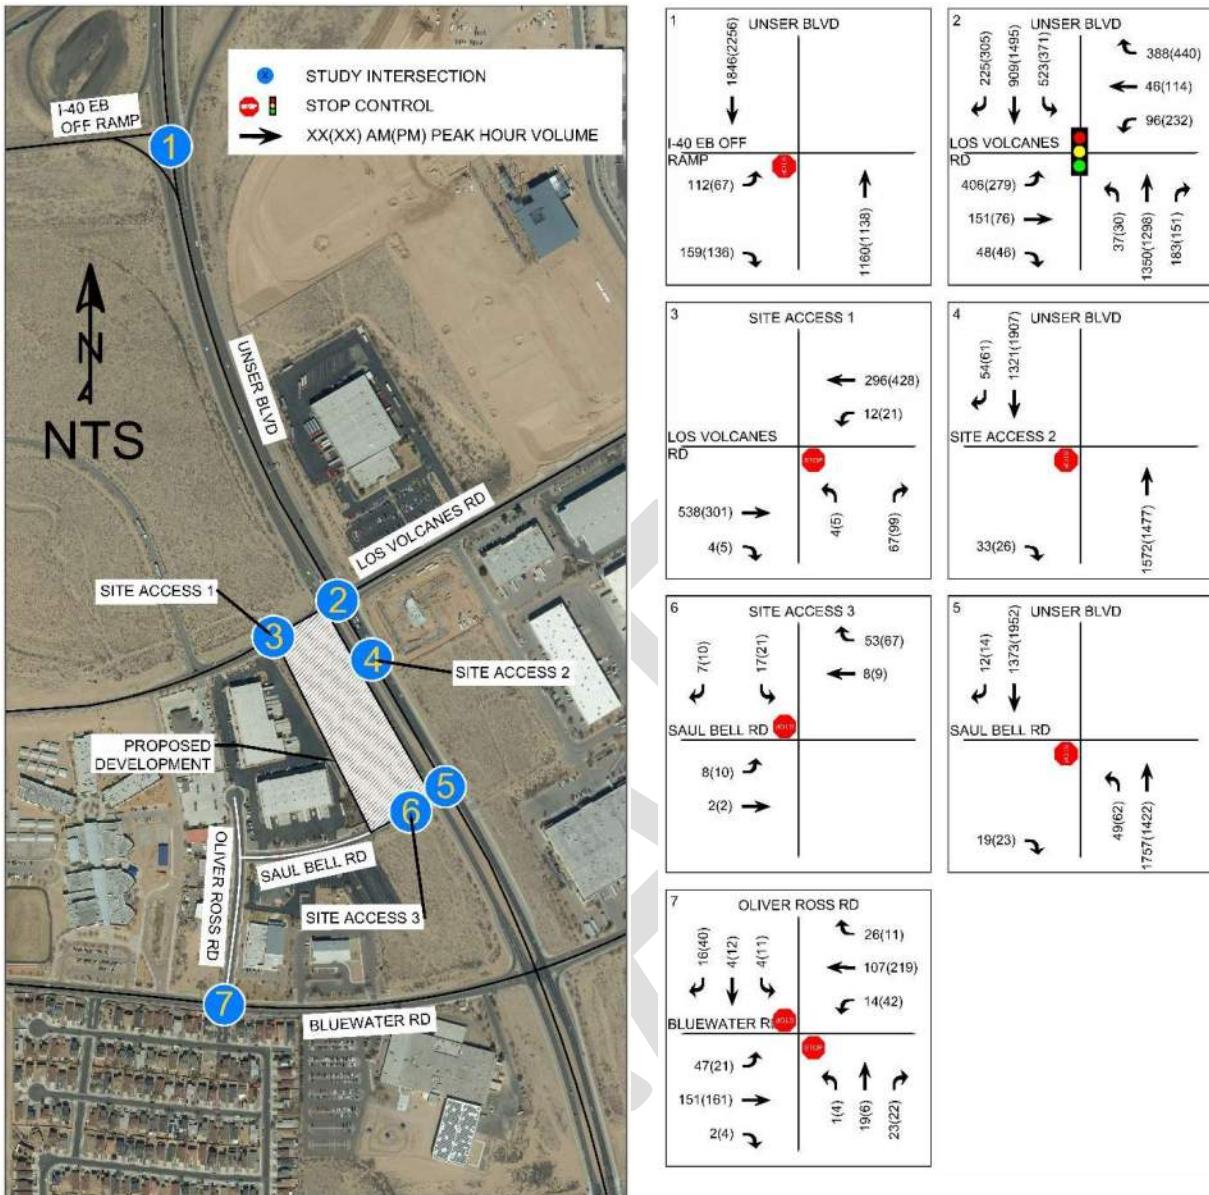

Figure 12: Horizon Year 2036 Full Build Volumes

SITE CONDITIONS AND SITE ANALYSIS

ASSUMPTIONS

The following assumptions regarding new developments in the roadway network were made for the Build-Out Year scenarios based on the information discussed in the scoping meeting:

- Site Access 2 on Unser Boulevard will operate as a right-in, right-out driveway.
- Access at Unser Boulevard and Saul Bell Road will construct a NBL lane.
- Per the scoping meeting, the NBR heading to the I-40 EB On-Ramp is not considered in this analysis as it is an uncontrolled, channelized right turn.

SITE ACCESS ANALYSIS AND JUSTIFICATION

Site access is to be provided via three driveways: One on the north side of the site accessing Los Volcanes Road, one on the east side of the site accessing Unser Boulevard, and one on the south side of the site accessing Saul Bell Road. CABQ DPM requirements were reviewed for the two access driveways. DPM Table 7.4.45 provides a minimum distance between commercial site access points and intersections, and DPM Table 7.4.46 provides the maximum number of commercial site access points per site. The results of this analysis are shown in Table 4 below.

Table 4: Access Spacing Requirements from CABQ DPM

Site Access	Major Street	Cross Street	Design Speed (MPH)	DPM Tables 7.4.45 Minimum Distance Between Commercial Site Access and Intersection		DPM Tables 7.4.46 Maximum Number of Commercial Site Access Points per Site	Distance Between Site Access Point and Intersection
				Approach Distance	Departure Distance		
Site Driveway 1	Los Volcanes (Major Collector)	Unser Blvd (Principal Arterial)	45	150 ft	150 ft	1 access point per 100 ft. frontage	215 ft
Site Driveway 2	Unser Blvd (Principal Arterial)	Los Volcanes (Major Collector)	35	200 ft	150 ft	1-2 access points per 300 ft. frontage	305 ft
Site Driveway 3	Saul Bell Rd (Local Collector)	Unser Blvd (Principal Arterial)	25	75 ft	75 ft	1 access point per 100 ft. frontage	75 ft

Per the information above, the driveways on Los Volcanes Road, Unser Boulevard, and Saul Bell Road meet CABQ DPM requirements. Although the Saul Bell Road driveway meets minimum CABQ DPM access spacing requirements, the auxiliary lane analysis presented before recommends additional distance between the driveway and the intersection of Unser Boulevard and Saul Bell Road to accommodate a westbound right turn lane.

SITE ACCESS JUSTIFICATION

The proposed Development will accommodate fueling operations for both heavy trucks and passenger vehicles, with passenger vehicle facilities at the south and east end of the site and heavy truck facilities at the north end. As designed, trucks would enter and exit the site from Site Driveway 1. This will ensure adequate turning space for trucks and mitigate the potential for exiting trucks to obstruct on-site traffic flow. This may include tanker trucks and trash pick-up. Site Driveway 1 provides direct access to the underground storage tanks and trash enclosure. Passenger vehicles would be able to enter and exit via Site Driveways 1, 2, or 3.

The access configuration shown in the site plan will accommodate anticipated ingress and egress movements as well as provide space for on-site and truck circulation. It should also be noted that recording devices at the intersection captured 10 vehicles making a northbound left turn into Saul Bell Road by maneuvering across the unpaved median. Articulated vehicles and passenger vehicles were observed making this maneuver.

The proposed Site Driveway 3 along Saul Bell Road will be served at the intersection of Unser Boulevard and Saul Bell Road, which is controlled by MRCOG Roadway Access Control Committee (RACC). In the MRCOG RACC plans, this policy includes provisions for a northbound left turn lane onto Saul Bell Road from Unser Boulevard. Figure 13 below is an excerpt from the MRCOG RACC.

Unser Boulevard between Central Avenue and Los Volcanes Road	
II. Between Central Avenue and Los Volcanes Road	A). This section is mostly developed and shall have existing access and future modifications under full management and jurisdiction of the City of Albuquerque with no review requirements by the RAC comm. Refer to section VII of the RAC Policy document. Pre-2019 Access is noted. 1). Central Avenue - full intersection 2). Sarracino Place - Access to the east at Sarracino Place until the adjacent properties redevelop or when the ultimate roadway is constructed. Permanent access will be reevaluated at that time through a traffic study. As of 2019 this is a full intersection. 3). Bluewater Road - full intersection 4). Property access right-in/right-out on east side just south of Saul Bell Road (approx. 700 feet north of Bluewater Rd) 5). Saul Bell Road - Left-turn bay from Unser Blvd northbound to Saul Bell Road westbound. R-12-01 TCC (it is right-in/right-out only in 2019)

Figure 13: MRCOG RACC Information for Unser Boulevard

AUXILIARY LANE ANALYSIS

CABQ DPM auxiliary lane analysis warrants were reviewed for the site access driveways. DMP Table 7.4.67 was used to determine if right or left-turn auxiliary lanes would be warranted for the site access points. DPM Tables 7.4.68 and 7.4.70 were used to assess deceleration and taper length, if applicable. It is important to note that 2023 Build-Out traffic volumes were used in the analysis. The results of this analysis are shown in Table 5. Build-Out Year Full-Build traffic volumes were used for the analysis.

Table 5: Site Driveway Auxiliary Lane Warrants

Location	Access/Turn Type	Speed	DPM Table 7.4.67 Turning Volume per Hour	Turning Volume per Hour (Build-Out Year Total)	Warrant Result	DPM Tables 7.4.68 Minimum Storage Length (ft)	DPM Tables 7.4.68/70 Lane Transition Length (ft)
Site Driveway 1 (Full Access)	Left In	35	40	12 (21)	Not Required	---	---
	Right In	35	50	4 (5)	Not Required	---	---
Site Driveway 2 (Partial Access)	Right In	45	45	54 (61)	Required	350-405	600-300 Reverse Curve
Site Driveway 3 (Full Access)	Left In	25	50	8 (10)	Not Required	---	---
	Right In	25	60	53 (67)	Required	240	150-150 Reverse Curve
NBL at Saul Bell Rd & Unser Blvd	Left In	45	50	49 (62)	Required	---	600-300 Reverse Curve

It is recommended that all development driveways adhere to the auxiliary lane provisions detailed in the CABQ DPM Section 7-4(I)(7) (iii(d)). Site Driveways 2, 3, and the NBL at the Unser Boulevard and Saul Bell Road intersection warrant the consideration of an auxiliary lane.

Site Driveway 2 is recommended to be constructed with a transition length of 600 FT with a 300 FT reverse curve. However, due to its proximity to the intersection of Unser Boulevard and Los Volcanes Road, it is recommended that the lane be constructed as long as possible without encroaching on the eastbound left turn lane.

Although an auxiliary lane is warranted for right turns at Driveway 3, a right turn auxiliary lane is not recommended for this driveway as the driveway's proximity to Unser Boulevard prevents its installation. Additionally, volumes on Saul Bell Road are anticipated to be lower than a typical city collector street.

The NBL at the Unser Boulevard and Saul Bell Road intersection warrants the consideration of a left turn lane. The left turn lane is recommended to be constructed with a lane transition of 600 to 300 FT reverse curve. Queueing considerations are analyzed and discussed in subsequent sections of this report.

SITE DRIVEWAYS SIGHT DISTANCE

The following presents a narrative detailing the development's recommended intersection sight distance requirements. Intersection sight distance requirements were calculated based on the CABQ DPM Section 7-4(I)(5)(iii) and the 2018 AASHTO "Green Book" chapter 9.5. Two sight distance cases were used for this analysis:

- Case B1 – A stopped vehicle turning left from a minor street approach onto a major road.
- Case B2 – A stopped vehicle turning right from a minor street approach onto a major road.

The intersection sight distance for Case B2 at all access driveways was calculated based on the assumption that the design vehicle turns into the nearest traffic lane. A combination truck was used as the design vehicle. The required sight distance values provided in Table 6 are rounded up to the nearest 5-foot increment. CABQ roadway characteristic cases are denoted as right turns (RT), left turns (LT), two-

lane (2L), four-lane (4L), divided (D), and undivided (U). Formulas, values, and calculations used in the sight distance analysis can be found in Appendix F.

Table 6: Required Sight Distance Values

Access Location	Posted Speed Limit (MPH)	AASHTO Case	AASHTO Sight Distance (FT)	CABQ Case	CABQ DPM Sight Distance (FT)
Los Volcanes Road & Site Access 1	35	B1	595	LT 2L-U	390
		B2	545	RT 2L-U	340
Unser Boulevard & Site Access 2	45	B1	N/A	N/A	N/A
		B2	695	RT 4L-D	430
Saul Bell Road & Site Access 3	25	B1	425	LT 2L-U	280
		B2	390	RT 2L-U	240

Using the values shown above, all development driveways are recommended to adhere to the sight distance provisions detailed in the AASHTO "Green Book," and CABQ DPM Section 7-4(I)(5)(iii). An area bounded by the above sight distances with the decision point placed 15 feet back from the edge of the shoulder midway between the outbound driving lane should be maintained clear of any obstructions. Sight distance for left-turning vehicles (Case B1) does not need to be provided on Unser Boulevard since this proposed intersection is partial access.

SITE ACCESS RECOMMENDATION

Trip generation and routing to and from the site would require three access points to prove adequate site circulation. The proposed site plan includes three access points: one on the north, one on the east, and one on the south end of the site. Three site driveways are recommended to accommodate anticipated ingress and egress movements as well as provide space for on-site and truck circulation.

Trip generation and routing through Site Driveway 3 would require the construction of a northbound left turn lane at the intersection of Unser Boulevard and Saul Bell Road. Including a northbound left turn lane at this intersection would also minimize delays and queuing impacts on the adjacent roads due to development traffic. Therefore, it is recommended that a northbound left turn lane be constructed at Unser Boulevard and Saul Bell Road, making this a partial access intersection. It is also recommended that a curb and gutter be constructed along the median of Unser Boulevard at the same time as the northbound left turn lane at Unser Boulevard and Saul Bell Road.

TRAFFIC ANALYSIS

Highway Capacity Software (HCS) was used to analyze the NMDOT owned study intersections for Level of Service (LOS) and 95th percentile queueing conditions. HCS implements methods and procedures detailed by the Highway Capacity Manual (HCM). For CABQ owned intersections, PTV Vistro was used to analyze the CABQ study intersections for Level of Service (LOS) and 95th percentile queueing conditions. Vistro implements methods and procedures detailed by the HCM. Detailed capacity output sheets showing all individual movements can be found in Appendix D.

LOS, CAPACITY, AND QUEUING ANALYSIS

Per the HCM, LOS is presented as a letter grade (A through F) based on the calculated average delay for an intersection or movement. Delay is calculated as a function of several variables, including signal phasing operations, cycle length, traffic volumes, and opposing traffic volumes, but it is a measurement of the average wait time a driver can expect when moving through an intersection. Factors such as total cycle time (for all movements), queueing restrictions, and vehicle volumes can affect measurements of delay, especially for lower-volume movements and side streets. Generally, these factors are only realized when delays reach or exceed LOS E thresholds. In such cases, a narrative is offered in subsequent sections specific to the individual movement in question.

Table 1 and Table 2 below, reproduced from the HCM, show delay thresholds and the associated Level of service assigned to delay ranges for signalized intersections and stop-controlled intersections, respectively. Generally, a LOS of D or better is considered an acceptable level of service.

Table 7: LOS Criteria and Descriptions for Signalized Intersections

Level of service	Average Control Delay (sec/vehicle)	General Description (Signalized Intersections)
A	≤10	Free flow
B	>10 – 20	Stable flow (slight delays)
C	>20 – 35	Stable flow (acceptable delays)
D	>35 – 55	Approaching unstable flow (tolerable delay, occasionally wait through more than one signal cycle before proceeding)
E	>55 – 80	Unstable flow (intolerable delay)
F	>80	Forced flow (jammed)

Table 8: LOS Criteria for Unsignalized Intersections

Level of service	Average Control Delay (sec/vehicle)
A	≤10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F	>50

Queueing is reported in feet for all intersections with queue lengths greater than one vehicle, with a base assumption of 20 feet queue length per vehicle. Queues are reported for queue measurements falling within the 95th percentile. It should be noted that 95th percentile queues are statistically expected to occur during only 5% of the peak hour's sign cycles. It is also noted that unreported average queueing at an intersection would statistically be much shorter than 95th-percentile queueing.

The volume-to-capacity (V/C) ratio is a performance measure that shows the ratio of traffic volume to the lane group capacity. A V/C ratio greater than 1.00 indicates that demand creates a residual queue for the analysis period.

For the purposes of this analysis, acceptable levels of service (LOS) are defined to be a LOS D or better. Based on procedures outlined in the HCM, intersection delay and level of service for stop-controlled intersections are reported as the delay and level of service for the worst-case movement at each intersection. For all other control types, they are taken for the whole intersection. Detailed output sheets can be found in Appendix D.

EXISTING YEAR 2024 CONDITIONS

Table 9 summarizes the intersection delay, level of service, and queueing under Existing Year 2024 conditions. The following conclusions are made from the Existing Conditions analysis:

Delay and LOS Results

At all intersections where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - NBL operates at LOS E during the AM and PM peak hours.
 - SBL operates at LOS F and LOS E during the AM and PM peak hours, respectively.
 - WBR operates at LOS E during the PM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard, both movements operate at unacceptable LOS during the AM and PM peak hours.

Queueing Results

At all intersections where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - SBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM and PM peak hours.

BUILD-OUT YEAR (2026) BACKGROUND CONDITIONS

For the 2026 background volumes, existing TMCs were used with an applied annual growth rate developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model. Table 10 summarizes the intersection delay, level of service, and queueing under Build-Out Year 2026 Background conditions. The following conclusions are made for the Build-Out Year Background analysis:

Delay and LOS Results

At all intersections where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - NBL operates at LOS E during the AM and PM peak hours.
 - SBL operates at LOS F during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard, both movements operate at unacceptable LOS during the AM and PM peak hours.

Queueing Results

At all intersections where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - SBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hours.

BUILD-OUT YEAR (2026) FULL-BUILD CONDITIONS

Trips generated by the proposed development were added to the 2026 Background volumes for analysis. Trip generation was performed using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition. Table 11 summarizes the intersection delay, level of service, and queueing under Build-Out Year 2026 Full-Build conditions. The following conclusions are made for the Build-Out Year Full-Build analysis:

Delay and LOS Results

At all other intersections where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - NBL operates at LOS E during the AM and PM peak hours.
 - SBL operates at LOS F during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard, both movements operate at unacceptable LOS during the AM and PM peak hours.

Queueing Results

At all intersections where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths.

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - SBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hours.

HORIZON YEAR (2036) BACKGROUND CONDITIONS

For the 2036 background volumes, 2026 background volumes were used with an applied annual growth rate developed from the MRCOG Metropolitan Transportation Plan (MTP) CUBE/2 Regional Model. Table 12 summarizes the intersection delay, level of service, and queueing under Horizon Year 2036 Background conditions. The following conclusions are made for the Horizon Year analysis:

Delay and LOS Results

At all other intersections where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - NBL operates at LOS E during the AM and PM peak hours.
 - SBL operates at LOS F during the AM peak hour.
 - WBR operates at LOS E during the AM and PM peak hours.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard, both movements operate at unacceptable LOS during the AM and PM peaks.

Queueing Results

At all intersections where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths.

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - SBL is expected to not accommodate the 95th percentile queue lengths during the AM peak hour.
- At the stop-controlled intersection of I-40 EB Off-Ramp and Unser Boulevard
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM and PM peak hours.

HORIZON YEAR (2036) TOTAL CONDITIONS

Trips generated by the proposed development were added to the 2036 Background volumes for analysis. Trip generation was performed using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition. Table 13 summarizes the intersection delay, level of service, and queueing under Horizon Year 2036 Full-Build conditions. Horizon Year 2036 Conditions were analyzed with existing signal timing. The following conclusions are made for the Horizon Year analysis:

Delay and LOS Results

At all intersections where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - NBL operates at LOS E during the AM and PM peak hours.
 - SBL operates at LOS F during the AM peak hour.
 - WBR operates at LOS E during the AM peak hour.

Queueing Results

At all intersections where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths except:

- At the signalized intersection of Unser Boulevard and Los Volcanes Road
 - SBL is expected to not accommodate the 95th percentile queue lengths during the AM and PM peak hours.

OFF-SITE CAPACITY MITIGATIONS

I-40 EB OFF-RAMP MITIGATIONS

The Intersection of the I-40 EB Off-Ramp and Unser Boulevard is expected to experience capacity and queueing issues in the Existing Background, Full Build, and Horizon conditions. Signalization of the intersection will resolve these issues. However, it is recommended that an interchange study be conducted as part of a regional effort with multi-jurisdictional involvement to determine an appropriate long-term future configuration for this interchange. For the purposes of this report, Table 14 below shows the capacity and queueing results under signalized control.

Delay and LOS Results

At the intersection where LOS results are present, all movements operate at acceptable LOS during the AM and PM peak hours.

Queuing Results

At the intersection where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths.

Table 14: I-40 EB Off-Ramp Summary with Mitigations

UNSER BOULEVARD AND LOS VOLCANES ROAD MITIGATIONS

MITIGATIONS

The intersection of Unser Boulevard and Los Volcanes Road is expected to experience capacity and queueing issues in the Existing, Background, Full Build, and Horizon scenarios. It is recommended that signal timing changes be implemented to resolve these issues as well as account for added traffic from the development. Table 15 and Table 16 summarize the intersection delay, level of service, and queueing under the Existing Background, Full Build, Mitigated Full Build, and Mitigated Horizon Full Build conditions. The following conclusions are made for the Mitigated analysis:

Delay and LOS Results

For the Build-Out Year (2026) Full Build Mitigated Conditions:

Where LOS results are present, all movements operate at acceptable LOS during the AM and PM peaks except:

- NBL operates at LOS E during the AM and PM peak hours. However, this failure is present in Existing, Background and Full Build scenarios.

For the Horizon Year (2036) Full Build Mitigated Conditions:

- NBL operates at LOS E during the AM and PM peak hours. NBL operates at LOS E during the AM and PM peak hours. However, this failure is present in Existing, Background, Full Build, Horizon Background, and Horizon Full Build scenarios. This low-volume movement failure can be attributed to signal delay. It should also be noted that the V/C ratio for this movement is less than one for all aforementioned scenarios. Therefore, no recommendations are made at this time.

Queueing Results

For the Build-Out Year (2026) Full Build and Horizon Year (2036) Full Build Conditions:

Where queue length results are present, existing storage lengths are sufficient to accommodate 95th percentile queue lengths.

Table 15: Unser Boulevard and Los Volcanes Road Summary with Mitigations

SUMMARY OF OFF-SITE CAPACITY MITIGATIONS

I-40 EB OFF RAMP

The I-40 EB Off-Ramp experiences unacceptable delays and queueing in the Existing, Background, Full Build, and Horizon scenarios. Signalization of the intersection would resolve these issues. However, it is recommended that an interchange study be conducted as part of a regional effort with multi-jurisdictional involvement to determine an appropriate long-term future configuration for this interchange.

UNSER BOULEVARD AND LOS VOLCANES ROAD

The traffic analyses for existing and future year scenarios show that capacity and queueing issues are present during the peak hours at the intersection of Unser Boulevard and Los Volcanes Road. Based on the capacity analysis results pertaining to the proposed site development, capacity mitigation or street improvements are required. Signal timing adjustments are recommended to account for shifting traffic patterns as a result of the development.

CRASH DATA SUMMARY

At the request of the NMDOT, a crash summary for the major intersections within the study area has been completed. The purpose of this analysis is to highlight trends and observations from summarized crash data. Crash data provided by the New Mexico Department of Transportation (NMDOT) for the years 2017 to 2021 is summarized in Table 17.

From the table below, the following observations are made:

- For the intersection of Unser Boulevard and Los Volcanes Road
 - Within the years 2018 to 2022, 161 crashes were reported.
 - The most common crash type was Other Vehicle – From Same Direction/ Both Going Straight
 - 55% of reported crashes occurred during daylight hours, and 32% occurred under Dark-Lighted or Dark-Not Lighted conditions.
 - No fatal crashes were reported from 2018 to 2022.
 - 36 injury crashes were reported, and 125 crashes were classified as Property Damage Only.
 - There was one pedestrian-involved crash reported.
 - The most common contributing factors were Driver Inattention and Failed to Yield Right of Way.
- For the intersection of Unser Boulevard and I-40 EB Off Ramp
 - Within the years 2018 to 2022, 29 crashes were reported.
 - The most common crash type was Other Vehicle – Both Going Straight/ Entering at Angle
 - 66% of reported crashes occurred during daylight hours, and 17% occurred under Dark-Lighted or Dark-Not Lighted conditions.
 - No fatal crashes were reported from 2018 to 2022.
 - Eight injury crashes were reported, and 21 crashes were classified as Property Damage Only.
 - There was one bicyclist-involved crash reported.
 - The most common contributing factors were Driver Inattention and Failed to Yield Right of Way.

CONCLUSIONS AND RECOMMENDATIONS

The following presents a summary of the traffic analysis, mitigations, and recommendations included in this report.

CONCLUSIONS

Traffic operation conclusions for the intersection of Unser Boulevard and Los Volcanes Road are summarized as follows:

- NBL operates at LOS E during the AM and PM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, Horizon Full Build, Build Out Full Build Mitigated, and Horizon Build Out Mitigated scenarios.
 - This failure is attributed to signal delay as the movement volume is low and the V/C ratio for this movement is less than one for all scenarios. Therefore, no recommendations are made to mitigate this movement.
- SBL operates at LOS F during the AM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, and Horizon Full Build scenarios.
 - Queue storage for this movement is expected to be exceeded.
- SBL operates at LOS E during the PM peak hours for the Existing Year scenario.
- WBR operates at LOS E during the AM peak hour for the Horizon Background and Horizon Full Build scenarios.
- WBR operates at LOS E during the PM peak hour for the Existing Year and Horizon Background scenarios.
- All other movements operate at acceptable levels of service (LOS) and have adequate storage to accommodate the 95th percentile queue lengths under analyzed scenarios.

Traffic operation conclusions for the intersection of I-40 EB Off-Ramp and Unser Boulevard are summarized as follows:

- All movements with HCM results are expected to experience unacceptable delays during the AM and PM peak hours for the Existing Year, Build Out Background, Build Out Full Build, Horizon Background, and Horizon Full Build scenarios.
 - EBL is expected to not accommodate the 95th percentile queue lengths during the AM and PM peak hours.
- All other movements operate at acceptable levels of service (LOS) and have adequate storage to accommodate the 95th percentile queue lengths under Existing Year conditions.

SITE RECOMMENDATIONS

Recommendations for study intersections directly serving and primarily impacted by the proposed development are provided as follows:

- Proposed Access Points and Locations:
 - It is recommended that three access points be constructed to provide adequate site circulation for ingress and egress trips as well as truck flow. A full-access configuration for Site Driveway 1, shown on the north end of the site, will provide adequate access for tanker trucks and trash pick-up. The two additional site driveways, one to the east and one to the south, will provide adequate access for passenger vehicles without creating conflicts with articulated trucks on the north end of the site. Driveway 3 will also provide adequate access for trucks.
 - The north Site Driveway 1 is recommended to be full access.
 - The east Site Driveway 2 is recommended to be partial access.
 - The south Site Driveway 3 is recommended to be full access.
- Unser Boulevard and east Site Driveway 2
 - When the intersection is constructed, a southbound right-turn deceleration lane is recommended on the southbound approach. The lane should be constructed as long as possible without encroaching on the existing intersection to the north.
- Unser Boulevard and Saul Bell Road / Site Driveway 3
 - Upon opening of the development, a northbound left-turn deceleration lane is recommended on the northbound approach, making this a partial access intersection. The lane should be constructed to store 50FT of vehicles with lane transition of 600 to 300 FT reverse curve.
 - It is also recommended that a curb and gutter be constructed along the median of Unser Boulevard between Los Volcanes and Bluewater.
 - Note: The MRCOG RACC includes provisions for a northbound left turn lane onto Saul Bell Road from Unser Boulevard. See Figure 13 for additional details.

OFF-SITE INTERSECTION RECOMMENDATIONS

Recommendations for intersections within the study area that do not directly serve the proposed development and are impacted by multiple developments in the area are provided as follows:

- Unser Boulevard and Los Volcanes Road
 - It is recommended that this signal be retimed by a Licensed Professional Traffic Operations Engineer (PTOE) to resolve capacity and queuing issues at this intersection. It is recommended that retiming be performed at or after opening day.
- I-40 EB Off-Ramp and Unser Boulevard
 - For all scenarios, the eastbound left and eastbound right are expected to experience unacceptable delays and queuing. While signalization of the intersection is shown to resolve these issues, it is recommended that an interchange study be conducted to determine an appropriate long-term future configuration for this. The interchange study should be conducted as part of a regional planning effort with multi-jurisdictional involvement, the scope of which is outside the purposes of this development traffic study.

Appendix A: Scoping Meeting Notes

**Agenda for Quik Trip #7001 Scoping Meeting
Unser & Los Volcanes
March 26, 2024**

Attendees:

Nancy Perea – NMDOT
Margaret Haynes – NMDOT
Matt Grush – CABQ
Keith Thompson – NMDOT

Daniel Chambers – Quik Trip
Graham Cook – Matkin Hoover
Josh Valencia – Matkin Hoover
Chris Wood – Matkin Hoover
Jonathon Kruse – Lee Engineering

1. Introductions
2. Review of Site Plan
 - a. Site Plan & Land Uses
 - b. Access Review
 - i. Note Unser controlled by MRCOG RACC. Study should include access justification for NBL at Saul Bell & Unser.

Unser Boulevard between Central Avenue and Los Volcanes Road	
	A): This section is mostly developed and shall have existing access and future modifications under full management and jurisdiction of the City of Albuquerque with no review requirements by the RAC comm. Refer to section VII of the RAC Policy document. Pre-2019 Access is noted.
II. Between Central Avenue and Los Volcanes Road	1): Central Avenue - full intersection
	2): Sarracino Place - Access to the east at Sarracino Place until the adjacent properties redevelop or when the ultimate roadway is constructed. Permanent access will be reevaluated at that time through a traffic study. As of 2019 this is a full intersection.
	3): Bluewater Road - full intersection
	4): Property access right-in/right-out on east side just south of Saul Bell Road (approx. 700 feet north of Bluewater Rd)
	5): Saul Bell Road - Left-turn bay from Unser Blvd northbound to Saul Bell Road westbound. R-12-01 TCC (it is right-in/right-out only in 2019)

3. Discussion of Scope for TIS
 - a. Study Intersections
 - i. I-40 EB Off-Ramps
 - ii. Unser & Los Volcanes
 - iii. Saul Bell & Unser
 - iv. Site Driveways
 - v. Count Oliver Ross Dr & Bluewater for Saul Bell access justification.
 - b. Data Collection
 - i. Existing Study Intersections
 - c. Trip Generation, Pass By, & Internal Capture
 - i. Trip Generation Manual (11th Edition) Land Use
 1. ITE 944 – Gasoline/Service Station
 - ii. Pass-by/Diverted trips
 - iii. No Internal Capture
 - iv. Trips distributed based on existing traffic patterns

- d. Known Developments or Pending Improvements in Area
 - i. Site east of Unser across from Saul Bell
 - ii. Site at Bluewater and Unser
- e. Build-out Year and Growth Rate
 - i. Build-Out Year (2026)
 - 1. Will look at Historic Traffic Volumes and calculate growth rate, if less than 1%, will assume 1% growth per year.
 - ii. Phase with two additional truck fueling positions in future.
- f. Analysis scenarios
 - i. Existing Conditions
 - ii. Opening Year Background (No Build)
 - iii. Opening Year Buildout (Full Build)
 - iv. Opening Year Buildout Optimized (if required)
 - 1. All scenarios with existing signal timings except opening year buildout optimized.
 - v. Horizon year – 10 Years from opening
- g. Required Analysis & Methodology
 - i. LOS Capacity and Queueing analysis based on HCM 6th Edition (HCS for NMDOT intersections. VISTRO for CABQ Intersections)
 - 1. Capacity & Queueing for network peak rather than individual intersection peaks
 - ii. No Arterial Analysis.
 - iii. Auxiliary Lane Analysis
 - iv. Sight Distance Analysis at Proposed Driveways
 - v. Safety (Crash) Summary
 - 1. Summary for Los Volcanes & Unser (5 years) for CABQ. Note excessive crashes and investigate high rates.
 - 2. Summary for EB I-40 Off Ramp (5 years) for NMDOT.
 - vi. Access Justification
- 4. Agency Input (Comments & Issues)
- 5. Meeting Notes (distributed by Lee Engineering)

Appendix B: Turning Movement Counts

Turning Movement Peak Hour Data Plot (3:45 PM)

Appendix C: ITE Trip Generation

Land Use: 944

Gasoline/Service Station

Description

This land use includes gasoline/service stations where the primary business is the fueling of motor vehicles. The sites included generally have a small building (less than 2,000 gross square feet) that houses a cashier and limited space for motor vehicle maintenance supplies and general convenience products. A gasoline/service station may also have facilities for servicing and repairing motor vehicles. The gasoline/service station may also have a car wash. Convenience store/gas station (Land Use 945) and truck stop (Land Use 950) are related uses.

Additional Data

The independent variable—vehicle fueling positions—is defined as the maximum number of vehicles that can be fueled simultaneously. The sites in this land use include both self-pump and attendant-pumped fueling positions and both pre-pay and post-pay operations.

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), California, Florida, Kentucky, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, Ontario (CAN), Oregon, South Dakota, Texas, and Washington.

Specialized Land Use Data

A 2006 study provided data on four private fuel facilities in Florida (source 721). These facilities provide self-fuel service for any motorist with a pre-established membership account. The site is not open to the general public. The trip generation characteristics of these sites differ from sites included in this land use; therefore, trip generation information for these sites is excluded from the data plots. The four sites have an average of nine vehicle fueling positions, with an average of 12 vehicle trips during the weekday, AM peak hour of adjacent traffic and 7 vehicle trips during the weekday, PM peak hour of adjacent street traffic.

Source Numbers

221, 274, 278, 288, 340, 350, 351, 355, 359, 366, 440, 583, 617, 618, 631, 721, 867, 882, 883, 888, 954, 977

Gasoline/Service Station (944)

Vehicle Trip Ends vs: Vehicle Fueling Positions
On a: Weekday

Setting/Location: General Urban/Suburban

Number of Studies: 18

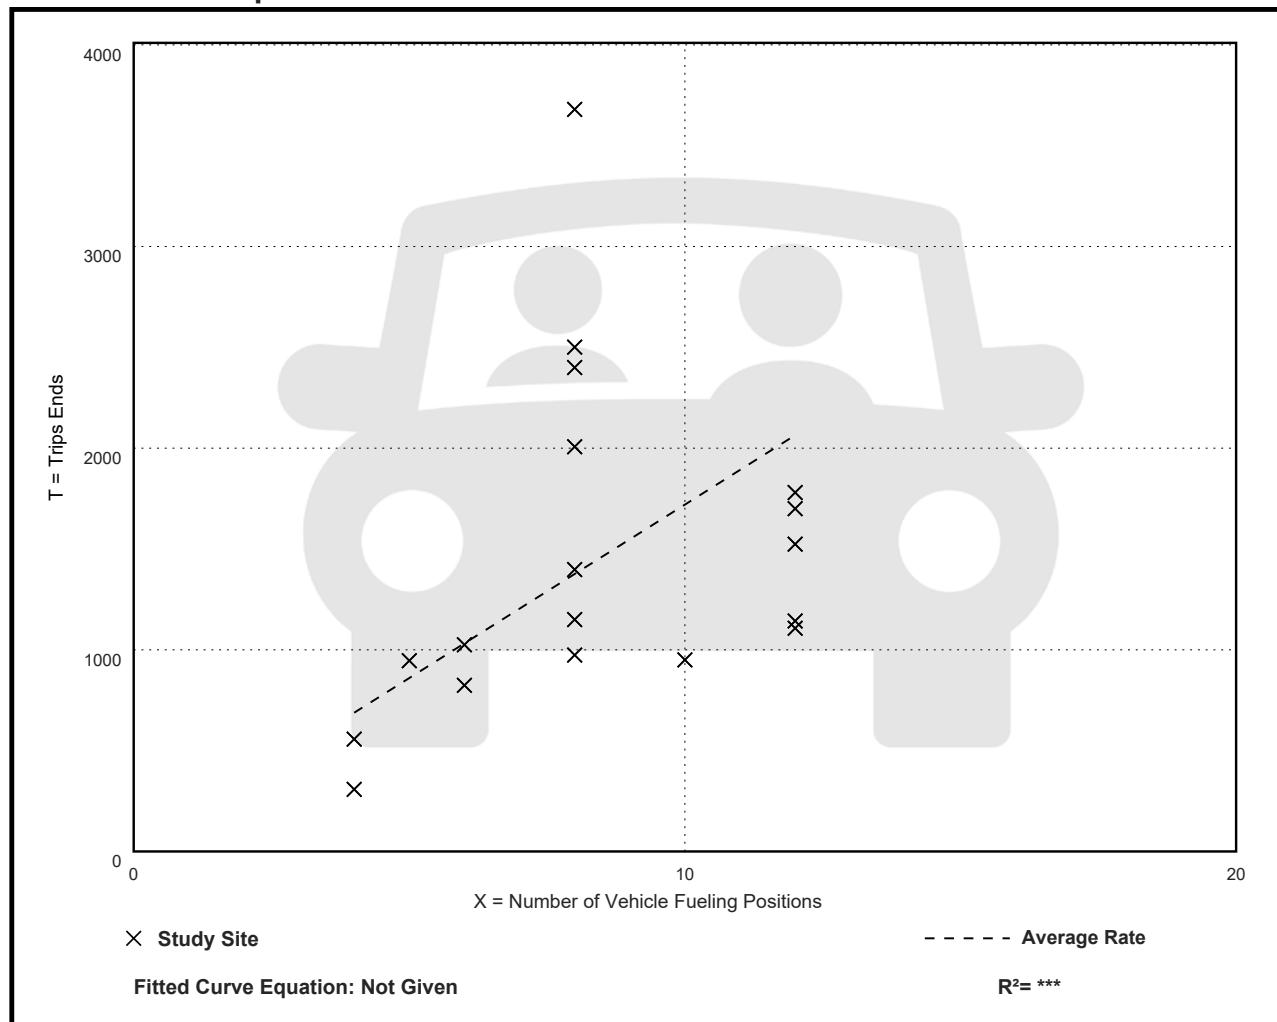

Avg. Num. of Vehicle Fueling Positions: 8

Directional Distribution: 50% entering, 50% exiting

Vehicle Trip Generation per Vehicle Fueling Position

Average Rate	Range of Rates	Standard Deviation
172.01	77.00 - 460.00	96.45

Truck Stop

Description

A truck stop is a facility located adjacent to an interstate highway interchange that provides commercial vehicle fueling, space and supplies for self-service vehicle maintenance, and other services specific to the needs of truckers (e.g., showers, on-site truck parking area). The facility typically contains a convenience store, restroom facilities, and one or more restaurants (either fast-food or high-turnover sit-down). Gasoline/service station (Land Use 944) and convenience store/gas station (Land Use 945) are related uses.

Additional Data

The trip generation data presented for this land use constitute commercial truck trips only.

The independent variable used in the data plots (vehicle fueling positions) refers to only the commercial fueling lanes at the truck stop.

The convenience store, restrooms, and restaurant(s) associated with a truck stop typically are also open to the general motoring public. The site often also includes vehicle fueling positions for the general motoring public. Additional information is needed in order to estimate non-truck vehicle trips generated by truck stops.

The truck trip generation rates per vehicle fueling position appear unreasonably high considering the length of time a trucker needs to fuel a vehicle. However, the detailed information provided in the data sources support the validity of the truck counts. It is apparent that not all trucks entering or exiting the truck stop are refueled. In those circumstances, the trucker could be using other services provided by the truck stop.

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 2000s and the 2010s in Colorado, Florida, Tennessee, Vermont, and Virginia.

To assist in the future analysis of this land use, it is important that the number of gasoline and diesel pumps at the study site be reported. It is also important to collect additional information on the number of non-truck trips generated at these sites.

Scenario 4 Background 2026 PM Scenario
5/17/2024

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.665	30.3	C
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.009	21.9	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Left	0.009	13.0	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	SB Left	0.702	39.0	D
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.006	15.7	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Thru	0.031	11.8	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Unser Blvd and Los Volcanes Rd

Control Type:	Signalized	Delay (sec / veh):	39.0
Analysis Method:	HCM 7th Edition	Level Of Service:	D
Analysis Period:	1 hour	Volume to Capacity (v/c):	0.702

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.665	30.3	C
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.009	21.9	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Left	0.009	13.0	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Unser Blvd and Los Volcanes Rd

Control Type:	Signalized	Delay (sec / veh):	30.3
Analysis Method:	HCM 7th Edition	Level Of Service:	C
Analysis Period:	1 hour	Volume to Capacity (v/c):	0.665

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	SB Left	0.764	64.3	E
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.007	16.8	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Thru	0.036	12.2	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.738	34.8	C
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.011	24.7	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	SB Left	0.025	13.7	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Unser Blvd and Los Volcanes Rd

Control Type:	Signalized	Delay (sec / veh):	34.8

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	SB Left	0.764	64.6	E
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.064	18.0	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	SB Left	0.008	12.4	B
6	Los Volcanes Rd and Site Driveway 1	Two-way stop	HCM 7th Edition	NB Left	0.012	17.3	C
7	Unser Blvd and Site Driveway 2	Two-way stop	HCM 7th Edition	EB Right	0.085	15.1	C
8	Saul Bell Road and Site Driveway 3	Two-way stop	HCM 7th Edition	SB Left	0.018	8.9	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Version 2023 (SP 0-0)

Intersection Settings

Located in CBD	No
Signal Coordination Group	1 - Coordination Group
Cycle Length [s]	110
Coordination Type	Time of Day Pattern Coordinated
Actuation Type	Fully actuated
Offset [s]	0.0
Offset Reference	Lead Green - Beginning of First Green
Permissive Mode	SingleBand
Lost time [s]	0.00

Phasing & Timing

Exclusive Pedestrian Phase

Pedestrian Signal Group	0
Pedestrian Walk [s]	0
Pedestrian Clearance [s]	0

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.602	36.4	D
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.058	16.7	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Thru	0.032	12.0	B
6	Los Volcanes Rd and Site Driveway 1	Two-way stop	HCM 7th Edition	NB Left	0.011	16.0	C
7	Unser Blvd and Site Driveway 2	Two-way stop	HCM 7th Edition	EB Right	0.077	14.1	B
8	Saul Bell Road and Site Driveway 3	Two-way stop	HCM 7th Edition	SB Left	0.018	8.9	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.641	30.7	C
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.111	24.5	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Left	0.009	13.5	B
6	Los Volcanes Rd and Site Driveway 1	Two-way stop	HCM 7th Edition	NB Left	0.013	15.0	B
7	Unser Blvd and Site Driveway 2	Two-way stop	HCM 7th Edition	EB Right	0.092	19.0	C
8	Saul Bell Road and Site Driveway 3	Two-way stop	HCM 7th Edition	SB Left	0.022	9.0	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.689	40.9	D
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.064	18.0	C
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	SB Left	0.008	12.4	B
6	Los Volcanes Rd and Site Driveway 1	Two-way stop	HCM 7th Edition	NB Left	0.012	17.3	C
7	Unser Blvd and Site Driveway 2	Two-way stop	HCM 7th Edition	EB Right	0.085	15.1	C
8	Saul Bell Road and Site Driveway 3	Two-way stop	HCM 7th Edition	SB Left	0.018	8.9	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Unser Blvd and Los Volcanes Rd	Signalized	HCM 7th Edition	NB Left	0.708	33.3	C
2	Unser Blvd & Saul Bell Rd	Two-way stop	HCM 7th Edition	EB Right	0.129	28.2	D
3	Bluewater Rd & Oliver Ross Dr	Two-way stop	HCM 7th Edition	NB Left	0.010	14.2	B
6	Los Volcanes Rd and Site Driveway 1	Two-way stop	HCM 7th Edition	NB Left	0.014	15.9	C
7	Unser Blvd and Site Driveway 2	Two-way stop	HCM 7th Edition	EB Right	0.105	21.3	C
8	Saul Bell Road and Site Driveway 3	Two-way stop	HCM 7th Edition	SB Left	0.022	9.0	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Appendix E: Intersection Sight Distance Calculations

INTERSECTION SIGHT DISTANCE CALCULATIONS

Reference: 2018 AASHTO "Green Book" chapter 9.5

Design Vehicle: Combination Truck

Major Road Lanes:

Unser Blvd	NB – 2 through lanes SB – 2 through lanes 15-ft wide Median
Los Volcanes Rd	EB – 1 through lane WB – 1 through lane
Saul Bell Rd	EB – 1 through lane WB – 1 through lane

Major Road Speed:

Unser Blvd: 45 MPH

Los Volcanes Rd: 35 MPH

Saul Bell Rd: 25 MPH

Case B1: A stopped vehicle turning left from a minor street approach onto a major road

Case B2: A stopped vehicle turning right from a minor street approach onto a major road

FORMULA:

$$ISD = 1.47 * V_{\text{major}} * t_g$$

Units: ISD (ft), V_{major} (MPH), and t_g (seconds)

Time Gaps (t_g):

11.5 (for combination truck turning left, crossing one lane of traffic)

10.5 (for combination truck turning right)

0.7 (added for each additional lane or 12-ft. median crossed)

SITE ACCESS 1

CASE B1 (LEFT TURN):

Assumption: Design vehicle is turning into the first lane of the major roadway.

Time Gap (t_g)= 11.5

$$ISD = 1.47 * 35 * 11.5 = 591.68 \text{ ft} \sim \mathbf{595 \text{ ft}}$$

CASE B2 (RIGHT TURN):

Assumption: Design vehicle is turning into the first lane of the major roadway.

Time Gap (t_g)= 10.5

$$ISD = 1.47 * 35 * 10.5 = 540.23 \text{ ft} \sim \mathbf{545 \text{ ft}}$$

SITE ACCESS 2

CASE B2 (RIGHT TURN):

Assumption: Design vehicle is turning into the first lane of the major roadway.

Time Gap (t_g)= 10.5

$$ISD = 1.47 * 45 * 10.5 = 694.58 \text{ ft} \sim \mathbf{695 \text{ ft}}$$

SITE ACCESS 3

CASE B1 (LEFT TURN):

Assumption: Design vehicle is turning into the first lane of the major roadway.

Time Gap (t_g)= 11.5

$$ISD = 1.47 * 25 * 11.5 = 422.63 \text{ ft} \sim \mathbf{425 \text{ ft}}$$

CASE B2 (RIGHT TURN):

Assumption: Design vehicle is turning into the first lane of the major roadway.

Time Gap (t_g)= 10.5

ISD= $1.47 \times 25 \times 10.5 = 385.88$ ft~ **390 ft**
