As the community official responsible for floodplain management, I hereby acknowledge that we have received and reviewed this Letter of Map Revision (LOMR) or conditional LOMR request. Based upon the community's review, we find the completed or proposed project meets or is designed to meet all of the community floodplain management requirements, including the requirements for when fill is placed in the regulatory floodway, and that all necessary Federal, State, and local permits have been, or in the case of a conditional LOMR, will be obtained. For Conditional LOMR requests, the applicant has documented Endangered Species Act (ESA) compliance to FEMA prior to FEMA's review of the Conditional LOMR application. For LOMR requests, I acknowledge that compliance with Sections 9 and 10 of the ESA has been achieved independently of FEMA's process. For actions authorized, funded, or being carried out by Federal or State agencies, documentation from the agency showing its compliance with Section 7(a)(2) of the ESA will be submitted. In addition, we have determined that the land and any existing or proposed structures to be removed from the SFHA are or will be reasonably safe from flooding as defined in 44CFR 65.2(c), and that we have available upon request by FEMA, all analyses and documentation used to make this determination.

#### 1 INTRODUCTION

Weston Solutions, Inc. (Weston) was contracted by the Bernalillo County Public Works Department (County) to provide a design update of the Cypress Drive Road Improvements project, first designed in 2009 by Resources Technology, Inc. (RTI) (acquired by Weston in 2009). The project segment of Cypress Drive crossest the jurisdictional boundary between the City of Albuquerque (City) and Bernalillo County.

Design and construction of this project was split into two phases, with construction of the first phase completed in 2011 and construction of the second phase completed in 2016. Weston is preparing this Letter of Map Revision (LOMR) application for submittal to the Federal Emergency Management Agency (FEMA) with the intent of updating the Special Flood Hazard Area (SFHA) to reflect the change in conditions.

#### 2 PROJECT LOCATION

Cypress Drive is residential street in southwest Albuquerque, New Mexico that runs east-west between Central Avenue and Atrisco Drive. The project segment of Cypress Drive starts at the intersection with Central Avenue, and runs east for approximately 1,800 feet where Cypress Drive crosses the Isleta Drain (See Figure 1 – Vicinity and Location Map).

The closest critical habitat from the Cypress Drive project site, which is for the Rio Grande Silvery Minnow, is approximately 0.55 miles to the east (See Figure 2 – Critical Habitat Map).

#### 3 PROJECT DESCRIPTION

The Cypress Drive Storm Drain Project was conceived to eliminate or reduce flooding along Cypress Drive by capturing the stormwater flows in a new storm drain system and discharge into the existing Isleta Drain. Please see Appendix A for a more detailed project information.

#### 4 TOPOGRAPHY

Alpha Professional Surveying, Inc. (Alpha) produced a topographic and planimetric map from field surveys of the right-of-way in 2009. Additional survey points were collected by Alpha in 2015 to supplement the current as-built conditions at that time. This data was used to prepare the storm drain and street design improvements. The coordinate system for the survey was tied to New Mexico State Plane Coordinates, Central Zone, North American Datum (NAD) 83, North American Vertical Datum (NAVD) 88 datum. Vertical control precision was for a 1-foot contour interval. For the drainage areas outside of the street right-of-way, the topographic survey was supplemented with contours from the Albuquerque/Bernalillo County LiDAR Mapping from 1999.

#### 5 HYDROLOGIC ANALYSIS

The hydrologic analysis used in this study was prepared by RTI in the Cypress Drive Road Improvements Feasibility Study dated March 2009. That study employed the 40-Acre and

Smaller Basins method, whose procedure is provided in the City of Albuquerque Development Process Manual (DPM) in Part A of Chapter 22. The three drainage areas (A, B and C) delineated are shown on the map presented as Figure 3. The hydrologic results are presented in Table 1 (reproduced from the RTI study).

Table 1: Hydrologic Calculation Results						
Basin	Area	10-Year Flow	100-Year Flow			
ID	(acres)	(cfs)	(cfs)			
A	5.17	9.7	17.0			
В	6.08	13.1	21.7			
С	2.46	5.3	8.8			

In order to overcome the hydraulic difficulties poised by the flat grades of Cypress Drive, an alternative approach, termed peaks and valleys, was adopted. The underlying storm drain was designed with inlets at each valley and six new drainage areas were created, one for each inlet (See Figure 3). The 100-year flow rates reaching each inlet are presented in Table 2 (reproduced from the RTI study), along with the currently constructed conditions.

Table 2: Design Flow Rates at Storm Drain Inlets					
Inlet-Basin ID	100-Year Flow	Constructed Inlet Type and Number			
	(cfs)				
1A	6.9	1 Modified MH Inlet (left) and 1 Double D (right)			
1B	6.8	1 Modified MH Inlet (left) and 1 Double D (right)			
2	9.3	2 Double Ds (1 each left and right)			
3	5.2	1 Single D (left) & 1 Modified MH Inlet (right)			
4	3.5	1 Single D (left) & 1 Modified MH Inlet (right)			
5	10.2	2 Double Ds (1 each left and right)			

Please see Appendix A for the detailed hydrologic analysis.

#### 6 HYDRAULIC ANALYSIS

The hydraulic analysis for this study was accomplished with a model of the Cypress Drive storm drain system using the U.S. Environmental Protection Agency's (EPA) Storm Water Management Model (SWMM) Version 5.1.

SWMM is capable of modeling complex storm drain systems using conservation of mass and momentum equations for gradually varied, unsteady flow, and employs the Manning equation for non-pressurized flow and either the Hazen-Willams or Darcy-Weisback equation for pressurized flow.

#### 6.1 Effective Model

An inquiry was placed to FEMA by the County, and an Effective Model does not exist for the project area. Therefore only a post-project hydraulic model was prepared for the current as-built conditions.

#### 6.2 Hydraulic Analysis Results

The available as-built data (See Appendices B and C) was used to create a storm drain network in SWMM. Due to the presence of surcharging in manholes, Dynamic Wave routing was used as the flow routing method. A summary of the hydraulic results are listed in Table 3, the water surface profile and detailed output files are in Appendix D.

As shown in Table 3, the section of pipe between Manholes F and G will surcharge, causing Pipe P-3 to flow under pressure. Although there is slight surcharging, the SWMM model is not predicting that any manholes will overflow.

#### **6.3 Floodplain Mapping**

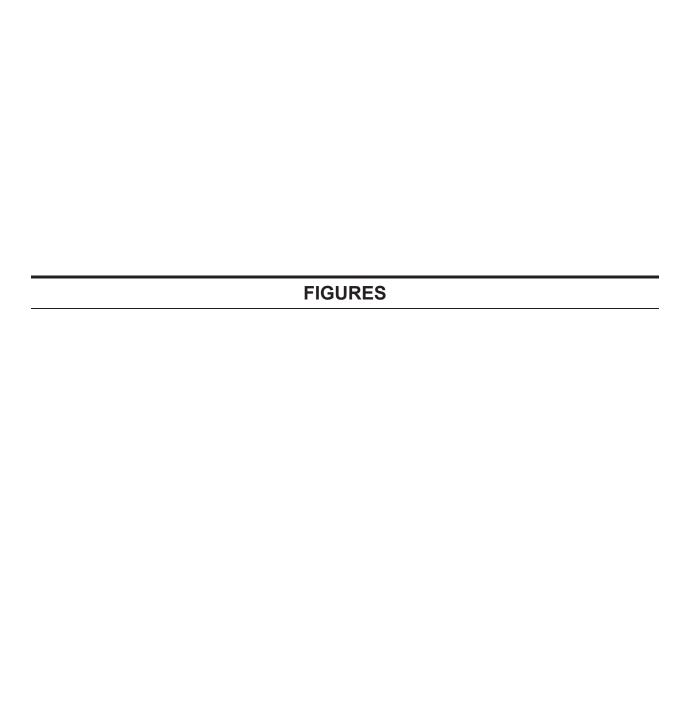

The floodplains from the current effective FIRM were mapped onto the Post-Project Conditions Work Map (Figure 4), which also shows the results of the post-project hydraulic analysis. Since the newly constructed Cypress Drive storm drain has capacity to contain and convey the 100-year design storm, this LOMR application proposes removal of the AH Zone at the eastern end of Cypress Drive. The Annotated FIRM, Figure 5, shows the AH Zone proposed for removal based on the post-project hydraulic analysis.
