RE: AGEX, INC. REVISED DRAINAGE REPORT

Dear Tom:

In a recent conversation with Dennis Lorenz of your staff, he indicated that the median along Central Avenue serves as a water block for any off-site runoff. Since the south side of Central is the only area directing runoff to the site, I have no objection to using a swale across the driveway in lieu of the RCP culverts. Therefore, I am approving the revised plans dated 2/22/82. Please see that the revised plans are placed in the construction set.

If I can be of any further help, please call.

Very truly yours,

Brian G. Burnett

RE: 10120 Central SW - Storage Building Addition

Dear Ms. Stewart:

Approval of the referenced construction plans is contingent on items 1 and 2, and with the understanding that the Certificate of Occupancy will be withheld pending compliance with said items.

- 1.) The submittal of a ~~Consolidated~~ Drainage Covenant to this office for review and processing.
- 2.) The approval of the proposed construction within the Highway Department's right-of-way.

Also please be advised that any future construction at the referenced address will require the adoption of the City approved street grades for 102 Street SW adjacent to your site on the grading and drainage plans.

If you have any questions regarding these items, please feel free to call me at 766-7644.

Sincerely,

Fred J. Aguirre, P.E.
Civil Engineer/Hydrology

Wolfgang G. Braun, Architect

Engineering Associates, Inc.
August F. Mosimann, P.E.
2819 Claremont Place, N.E.
Albuquerque, New Mexico 87110

DESIGN GUIDELINES

The building site is located at the intersection of 162nd Street and Central Avenue southwest. The excess runoff due to development of the site will be ponded on the site and dispersed into the ground.

The formulas used for the computation of flow and volume are as follows:

Rational Formula $Q = CIA$

and

Volume Formula $V = CPA$

Where Q = Runoff rate (CFS)
 I = Intensity (in/hr)
 A = Area (Acres or Sq.Ft.)
 V = Volume (Cu.Ft.)
 C = Runoff Coefficient
 P = Precipitation (in)

The precipitation amount for this area is 2.2 inches (See Figure 1).

The runoff coefficients C are .4 for undeveloped areas and landscaped areas and .9 for impervious areas.

OFFSITE FLOWS (Refer to Figure 2)

There is an undeveloped area to the west of the site which contributes an offsite flow. Its area is 14 acres.

The runoff coefficient is .4
 The slope is 2%
 The length of runoff is 900 ft.
 The concentration time is 19 min. (Figure 3)
 The intensity is $\frac{189}{19 + 25} = 4.3$ min. (Figure 4)

The flow is
 $Q = CIA = .4 \times 4.3 \times 14 = 24$ CFS

This flow is carried by an existing natural arroyo and the developed site will not alter this arroyo.

Another offsite flow which will affect the site is the runoff from Central Avenue into its shoulder ditch. A 24" corrugated metal culvert will be provided at each drive to carry this flow.

EXISTING SITE STUDY (Refer to Figure 2)

The existing site consists of sparse vegetation and covers 4.41 acres. The storm runoff is toward the east onto other undeveloped land.

The runoff coefficient is 0.4.
 The land slope is 4%.
 The length of runoff is 200 ft.
 The concentration time is 12 min. (Figure 4)
 The intensity is $\frac{189}{12 + 25} = 5.11$ min.

The flow is

$$Q = CIA = .4 \times 5.11 \times 4.41 = 9.24 \text{ CFS}$$

The runoff volume is

$$V = CPA = .4 \times 2.2 \times 4.41 \times 43560/12 = 14087 \text{ Cu.Ft.}$$

DEVELOPED SITE STUDY

The developed site will consist of a 6090 S.F. building and 23624 S.F. of paving. The difference in runoff development between developed and undeveloped states is as follows:

Developed Site Runoff Volume

$$V = CPA = .9 \times 2.2 \times \frac{23624}{12} = 3898 \text{ Cu.Ft.}$$

Undeveloped Site Runoff Volume is

$$V = CPA = .4 \times 2.2 \times \frac{23624}{12} = 1732 \text{ Cu.Ft.}$$

The difference is 2166 Cu.Ft.

This difference will be collected and percolated into the ground.

RECOMMENDATIONS AND CONCLUSIONS

1. Grade the site so that the runoff from the building and paved area will be directed into a 2166 Cu.Ft. ponding area to the southeast of the building.
2. Provide a 24" culvert beneath the entrance drives along Central Avenue.
3. The offsite flow across the property south of the building will not affect the current development. If any future developments are planned for this area they will have to contend with this offsite flow.

PLEASE RETURN WITH PLANS

10120 CENTRAL S.W. (ATASCOC GRANT LOT 5 B.N.1)
STANDARD REQUIREMENTS FOR DRAINAGE PLANS

PURPOSE: The increasing volume of drainage plans submitted to this office makes it mandatory that such plans be standardized as much as possible in order to expedite reviews. This standardization is as much to the advantage of the developer and engineer as it is to the Hydrology Section which enforces the AMAFCA RES. 72-2. For parcels of land less than 20,000 sq. ft. in surface area no formal drainage report is required; the construction plans need only to include the standard form attached herein and the site drainage plan. Developers for larger parcels of land will have to submit a formal drainage report as specified in the Resolution.

RUNOFF PONDING: In most instances on site ponding is mandatory, with dispersal in the ground of the excess runoff arising from newly created impervious surfaces. The only exception allowed, is for those properties adjacent to a diversion channel which was designed for higher standard than 100 years frequency storm (existing conditions). For detailed computations of the runoff before and after development the assumed runoff coefficient recommended are $C = 0.4$ for undeveloped, landscaped or similar open areas and $C = 0.9$ for all other impervious surfaces, including areas in southwestern type landscaping with underlying polyethylene film and gravel covered parking areas where vehicular traffic will compact the soil and render it impervious. Due to the inadequacy of the existing drainage facilities in the valley area and to the limited capabilities of the City for providing relief, ponding requirements in the valley are higher than elsewhere.

COMPUTATION OF VOLUME OF RETENTION:

$$\text{Valley Area} = 1.0 \times \frac{2.2''}{12''} \times \text{Area (ft.)} = 0.18 \times A$$

$$\text{East and West Mesa} = (0.9 - 0.4) \times \frac{2.4''}{12''} \times \text{Area (ft.)} = 0.1 \times A$$

In order to facilitate the design of drainage facilities, a checklist that will be followed in the review process is listed below:

CHECK LIST

1 - Flooding potential - adjacent water courses

NO Is property located in the flood plain? *LB KNOWN 19 FLOOD PLAIN INFORMATION LB*

If so, is the finished floor above the 100 yrs. flood level?

YES Is property adjacent to a natural or artificial water course?

If so, what are the specific AMAFCA or City requirements?

STANDARD REQUIREMENTS FOR
DRAINAGE PLANS

-2-

NO Are drainage R.O.W or easements shown on, or in the proximity of property? If so, are there drainage problems?

2 - Relation of property to surroundings

YES Per topo map, does property intercept other drainage upstream?

If so, how is runoff conveyed across property?

May there be erosion associated with offsite runoff conveyance?

May erosion or siltation result from proposed construction activities?

NO Does development block drainage from adjacent property?

3 - Site grading

Does site plan show contours before development (extending a minimum of 25 ft. beyond property lines)?

NO Does site plan show proposed grading with adequate swale definition to convey water to ponds?

Is all runoff conveyed to ponding areas before it overflows to public facilities?

NO Does the proposed grading plan indicate that under cutting or back-filling adjacent to property lines may require retention walls?

Is there continuity between proposed new contours and old contours offsite?

Is elevation of property line at least 0.3 ft. above top of curb?

4 - Storm water retention

YES Is ponding volume adequate (supply detailed computation)?

NO Are ponds balanced with areas they drain (can area draining to each pond be easily identified and will actually water flow there)? The plot plan must outline each drainage area. DRAINAGE REPORT CALLS FOR GRADING THAT WILL DRAIN THE RUNOFF FROM THE BUILDING AND PAVED AREA.

yes Can pond volume be computed and verified?

Are ponds practical, can they be built as shown?

5 - Safety

Do the drainage provisions constitute an attractive nuisance, or safety hazard?

STANDARD REQUIREMENTS FOR
DRAINAGE PLANS

-3-

If the pond depth is greater than 18", are safety provisions supplied?
(Minimum 3.0 ft. high chain link fence or similar physical barrier
of ponding areas are adjacent to public R.O.W.?)

In general, ponds of depth greater than 18" will not be accepted for
both safety consideration and for long term effectiveness of the
facilities. In those cases where limited space is available for
ponding, the use of gravel pits under the parking areas is suggested.
It must be pointed out that mainstream and effectiveness of these
facilities is necessary and is the responsibility of the owner.
Existing or planned City facilities (streets, channels, storm sewers)
can accommodate the natural runoff volumes. Greater discharges would
cause flooding downstream and need to be limited at the source.

DRAINAGE STUDY
for
AGEX INCORPORATED

Wolfgang G. Braun, Architect

Engineering Associates, Inc.
August F. Mosimann, P.E.
2819 Claremont Place, N.E.
Albuquerque, New Mexico 87110

DESIGN GUIDELINES

The building site is located at the intersection of 102nd Street and Central Avenue southwest. The excess runoff due to development of the site will be ponded on the site and dispersed into the ground.

The formulas used for the computation of flow and volume are as follows:

Rational Formula $Q = CIA$

and

Volume Formula $V = CPA$

Where Q = Runoff rate (CFS)
 I = Intensity (in/hr)
 A = Area (Acres or Sq.Ft.)
 V = Volume (Cu.Ft.)
 C = Runoff Coefficient
 P = Precipitation (in)

The precipitation amount for this area is 2.2 inches (See Figure 1).

The runoff coefficients C are .4 for undeveloped areas and landscaped areas and .9 for impervious areas.

OFFSITE FLOWS (Refer to Figure 2)

There is an undeveloped area to the west of the site which contributes an offsite flow. Its area is 14 acres.

The runoff coefficient is .4
 The slope is 2%
 The length of runoff is 900 ft.
 The concentration time is 19 min. (Figure 3)
 The intensity is $\frac{189}{19 + 25} = 4.3$ min. (Figure 4)

The flow is
 $Q = CIA = .4 \times 4.3 \times 14 = 24$ CFS

This flow is carried by an existing natural arroyo and the developed site will not alter this arroyo.

Another offsite flow which will affect the site is the runoff from Central Avenue into its shoulder ditch. A 24" corrugated metal culvert will be provided at each drive to carry this flow.

EXISTING SITE STUDY (Refer to Figure 2)

The existing site consists of sparse vegetation and covers 4.41 acres. The storm runoff is toward the east onto other undeveloped land.

The runoff coefficient is 0.4.

The land store is 4%.

The length of runoff is 200 ft.

The concentration time is 12 min. (Figure 4)

The intensity is $\frac{189}{12 + 25} = 5.11/\text{min.}$

The flow is

$$Q = CIA = .4 \times 5.11 \times 4.41 = 9.24 \text{ CFS}$$

The runoff volume is

$$V = CPA = .4 \times 2.2 \times 4.41 \times 43560/12 = 14087 \text{ Cu.Ft.}$$

DEVELOPED SITE STUDY

The developed site will consist of a 6090 S.F. building and 23624 S.F. of paving. The difference in runoff development between developed and undeveloped states is as follows:

Developed Site Runoff Volume

$$V = CPA = .9 \times 2.2 \times \frac{23624}{12} = 3898 \text{ Cu.Ft.}$$

Undeveloped Site Runoff Volume is

$$V = CPA = .4 \times 2.2 \times \frac{23624}{12} = 1732 \text{ Cu.Ft.}$$

The difference is

2166 Cu.Ft.

This difference will be collected and percolated into the ground.

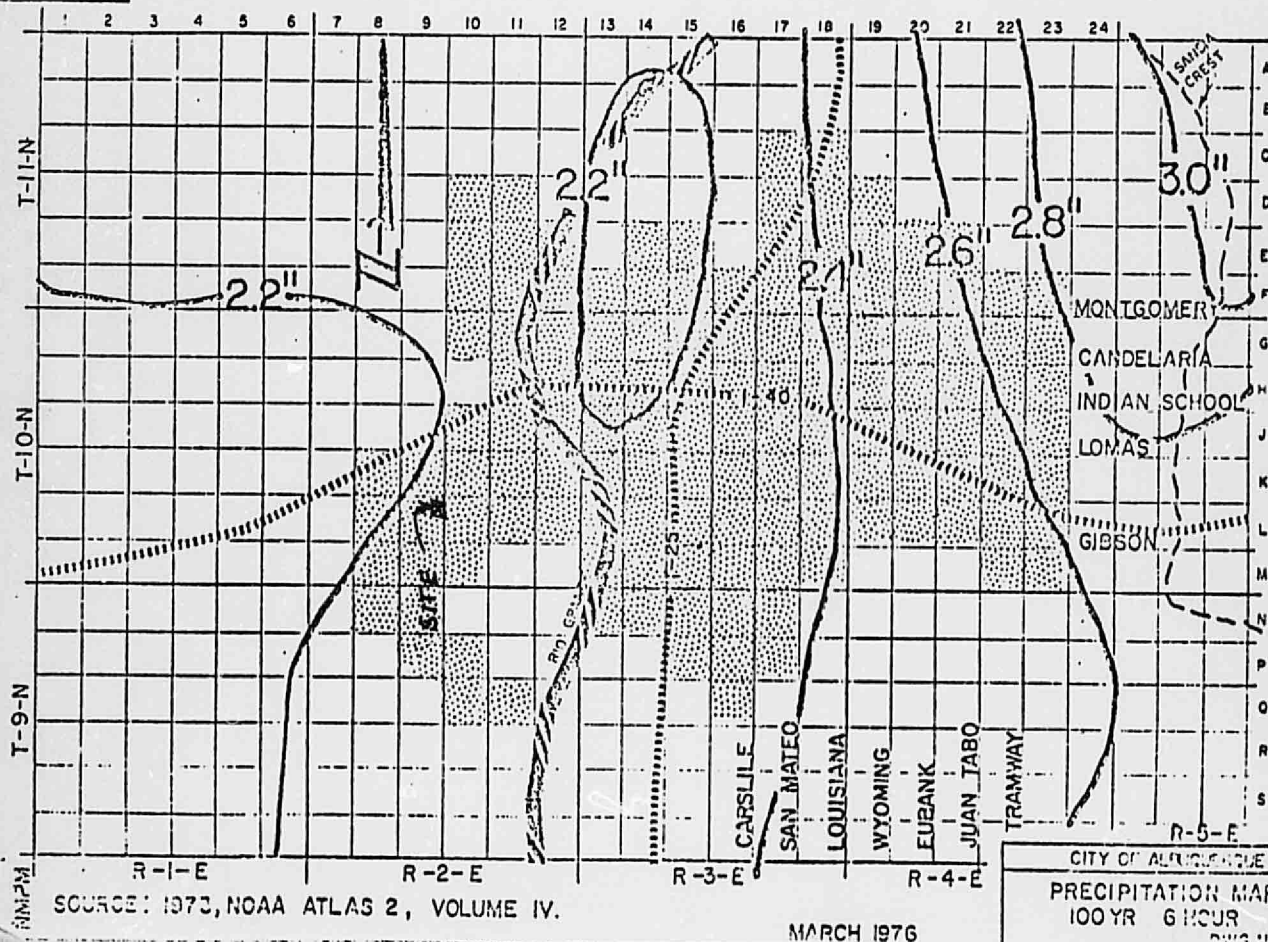

RECOMMENDATIONS AND CONCLUSIONS

1. Grade the site so that the runoff from the building and paved area will be directed into a 2166 Cu.Ft. ponding area to the southeast of the building.

2. Provide a 24" culvert beneath the entrance drives along Central Avenue.

3. The offsite flow across the property south of the building will not affect the current development. If any future developments are planned for this area they will have to contend with this offsite flow.
