I. INTRODUCTION

Rio Bravo Boulevard is a limited access four-lane divided arterial roadway within the unincorporated area of Bernalillo County running east and west between Interstate 25 and Coors Boulevard. Rio Bravo Boulevard is a very important corridor within the County as it connects with several major north-south arterials as well as forming an interchange with Interstate 25 (I-25). East of I-25, Rio Bravo Boulevard becomes University Boulevard, and serves as an access to the Albuquerque International Airport.

A Commuter rail station (Rio Bravo/Airport Station) has been proposed for the newly constructed Railrunner railway facility. This railway station is to be located on the northeast corner of Second Street and Rio Bravo Boulevard. There will be 166 regular and six (6) disabled parking spaces at this facility. This analysis will focus on the segment of Rio Bravo Boulevard between Prince Street and Second Street (the segment of Rio Bravo that is adjacent to the railroad property).

II. PROJECT PURPOSE

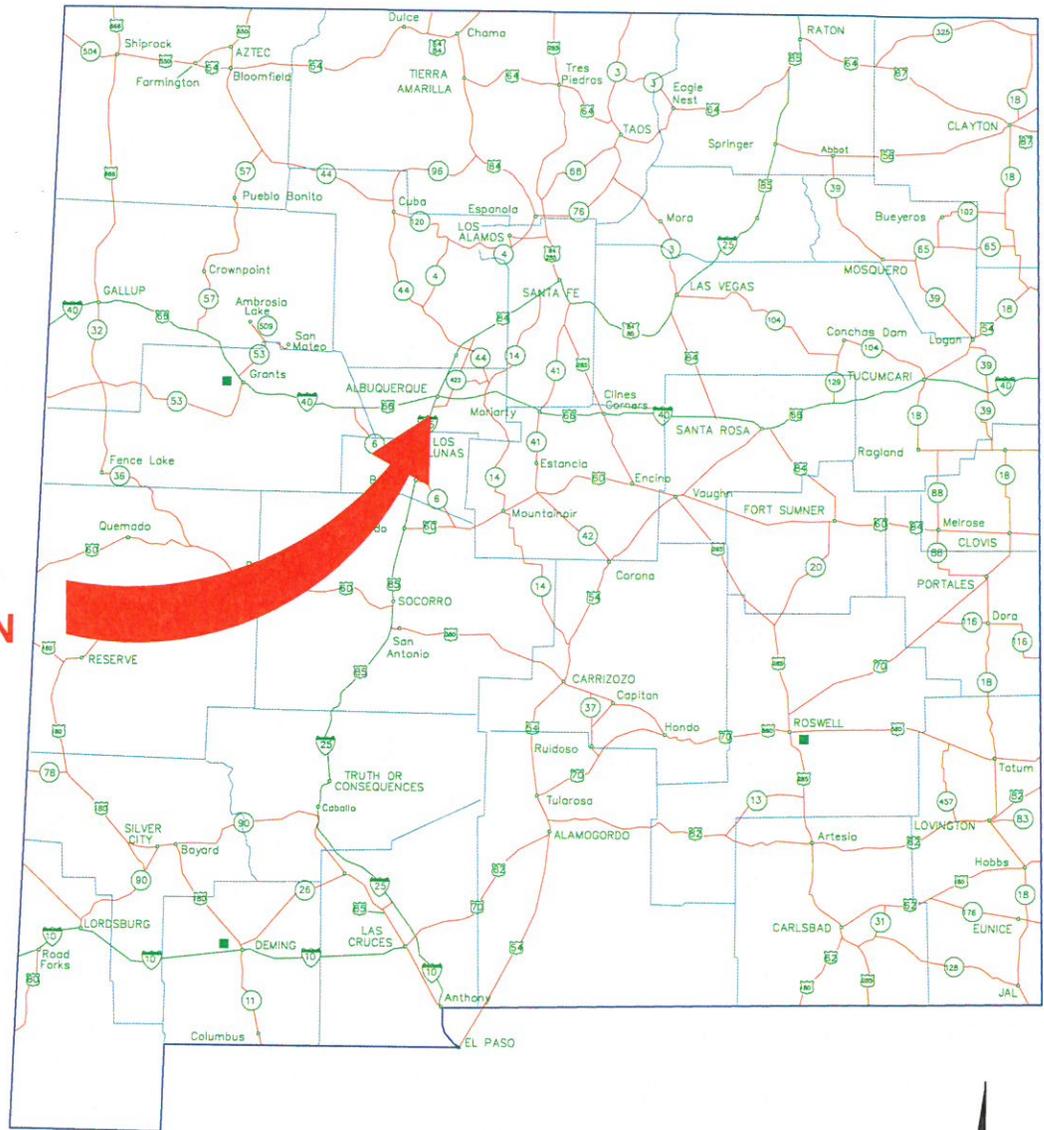

HDR Engineering, Inc. (HDR) has been retained to perform an analysis of existing and future traffic conditions on Rio Bravo Boulevard between Broadway Boulevard and Second Street. The primary project purpose is to analyze the need for a right-turn access/deceleration lane from westbound Rio Bravo Boulevard to provide an alternate access onto the Commuter rail station site. As part of this analysis, HDR will conduct a field inventory that includes roadway conditions, lane configurations, and existing signing.

III. PROJECT DESCRIPTION

The segment of Rio Bravo Boulevard to be reviewed in this analysis begins at the intersection of Rio Bravo at Prince Street and ends at the Second Street intersection. These two intersections are signalized and will be analyzed for existing and future conditions. The segment of Rio Bravo Boulevard to be analyzed is approximately 0.33 miles (1,760 feet) in length.

Please refer to Figures III.A.1, III.A.2 and III.A.3 for location, vicinity and site maps illustrating the project area.

III.A EXISTING FUNCTIONAL CLASSIFICATIONS

The functional classification of roadways forms the framework of the transportation system and defines its function and use related to access and mobility. Design and operational parameters, such as roadway capacity and posted speed limits are designated relative to the roadway functional classification. A hierarchy of roadway functional classifications is described below:

Principal Arterial Streets. This type of roadway constitutes the highest ranking of roadway within most jurisdictions, serving to connect various areas of a municipality. Principal arterials usually connect arterial and collector streets to larger regional facilities such as interstates, freeways and state highways.

Minor Arterial Streets. Mobility is the main purpose of a minor arterial street. While they serve a secondary function of access to properties along the corridors, their primary function is servicing the most traffic; therefore, arterials typically have the most lanes and higher speeds in order to provide greater capacity.

Collector Streets. These facilities serve as intermediate links between local and arterial streets, serving both access and mobility needs. Their primary function is to collect local traffic from adjacent neighborhoods and transport traffic to the arterials where the lengthier trips are made. Some collectors are discontinuous; however, they provide good connectivity to the arterial streets.

Local Streets. The purpose of local streets is to provide access to adjacent land uses. Local streets comprise of highest number of lane-miles in a roadway network but carry the lowest volume of traffic. They are typically designed to discourage through traffic while providing access from adjacent properties to the roadway network via collector streets. These base levels facilities were not analyzed in the study, as their purpose is to provide access and not traffic mobility.

III.B EXISTING CORRIDOR CONDITIONS

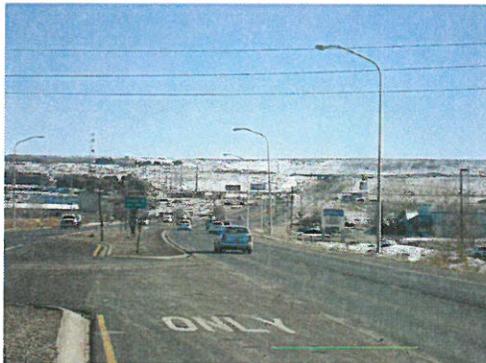

III.B.1 STREET SEGMENT DESCRIPTIONS

There are three streets which will be analyzed as part of this analysis: Rio Bravo Boulevard, Prince Street and Second Street:

III.B.1.1 RIO BRAVO BOULEVARD

Rio Bravo Boulevard between Second Street and Broadway Boulevard SE is a limited access four-lane principal arterial roadway with two lanes of travel for each direction, divided by a raised median. There is a portion of eastbound Rio Bravo Boulevard just east of Prince Street that has three lanes; however, the third lane drops before the next intersection to the east (Broadway Boulevard). Rio Bravo Boulevard is a very important corridor within the South Valley of Bernalillo County as it connects with several major north-south arterials as well as forming an interchange with I-25 approximately 1 mile east of the project site. Full access points (median breaks) are provided at two locations onto Rio Bravo Boulevard between Prince Street and Broadway Boulevard, as well as three locations between Prince Street and Second Street.

The posted speed limit for Rio Bravo Boulevard within the study area is 45 mph. The roadway has 12 foot lane widths, 10 to 12 foot paved shoulders, and 24-foot wide medians. Along the south side of the street, there is a bike trail, which is parallel to and separated from Rio Bravo Boulevard through the length of the study area. Please refer to the pictures below showing eastbound and westbound Rio Bravo Boulevard between Prince Street and Second Street:

EB Rio Bravo between Second St./Prince St.

WB Rio Bravo between Second St./Prince St.

III.B.1.2 PRINCE STREET

Prince Street is a local two-lane local roadway, running north and south. There is very little traffic on Prince Street north of the intersection with Rio Bravo Boulevard; the street dead-ends about ½ mile north of Rio Bravo Boulevard and most of the traffic on this segment is generated by an industrial land use located approximately ¼ mile north of Rio Bravo Boulevard. This segment of Prince Street also is the eastern border of the railroad property where the proposed Rio Bravo/Airport station is to be constructed. An access road to the station is proposed to connect with Prince Street approximately 300 feet north of its intersection with Rio Bravo Boulevard. At this time, the access from Prince Street is the only proposed access to the station.

Prince Street south of Rio Bravo Boulevard is a two-lane roadway with a posted speed limit of 25 mph that serves a residential area beginning about ½ mile south of the intersection of Rio Bravo Boulevard. Prince Street terminates approximately one mile south of Rio Bravo Boulevard where it intersects with Prosperity Avenue.

The pictures below show Prince Street north of Rio Bravo Boulevard at the proposed location of the entrance driveway to the railway station:

Prince Street looking north from proposed access to station

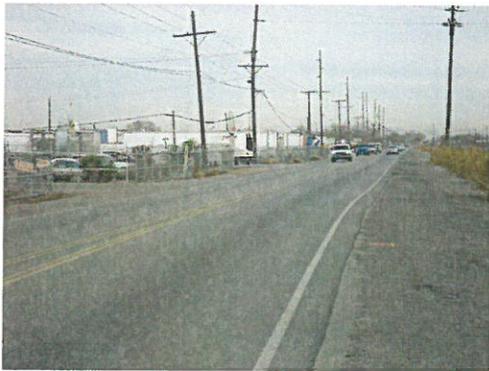

Prince Street looking south from proposed access to station

III.B.1.3 SECOND STREET

Second Street is an undivided two-lane collector roadway that runs north and south and serves adjacent residential, commercial and industrial land uses. The posted speed limit for Second Street is 45 mph and there are frequent driveway access points that serve adjacent businesses on the west side of the street. The pictures below illustrate Second Street in the area of the railway station:

Second Street north Rio Bravo Blvd.
looking northbound

Second Street north of Rio Bravo Blvd.
looking southbound

The railroad runs parallel to Second Street throughout this area. The proposed railway station will front Second Street north of Rio Bravo Boulevard, although an access point to the station from Second Street is not planned at this time. Please refer to the picture below which shows the station site:

BNSF Railroad looking east from proposed site

III.B.2 INTERSECTION DEFINITIONS

The American Association of State Highway and Transportation Officials (AASHTO) define an intersection in *A Policy on Geometric Design of Highways and Streets* ("The Green Book") as:

'The general area where two or more highways join or cross, including the roadway and roadside facilities for traffic movements within the area. The three general types of highway crossings are at-grade interchanges, grade separations without ramps and interchanges.'

III.B.2.1 INTERSECTION INVENTORY

The study segment of Rio Bravo Boulevard contains the two signalized intersections that are closest to the proposed railway station. The analysis of the signalized intersections includes pictures of each approach to the intersection as well as lane configuration exhibits. Following are descriptions of each intersection to be analyzed:

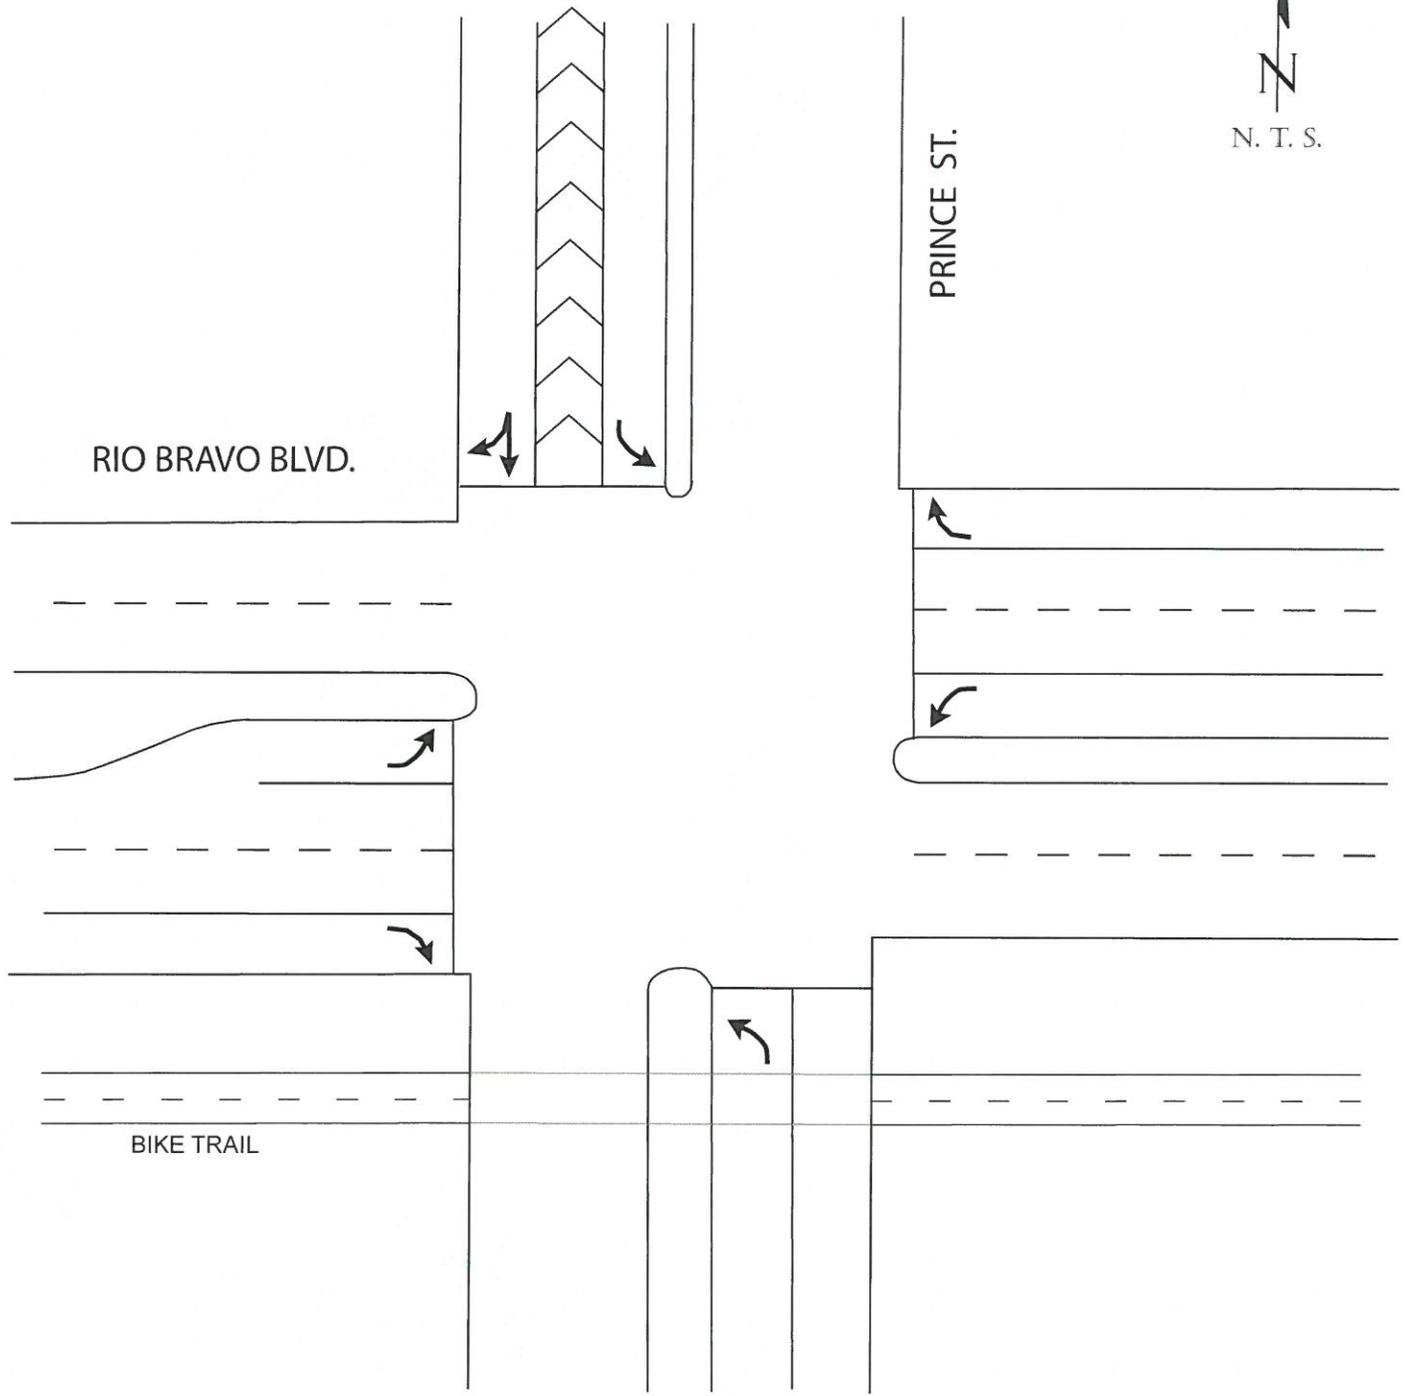

III.B.2.2 PRINCE STREET AT RIO BRAVO BOULEVARD

The Prince Street/Rio Bravo Boulevard intersection is controlled by an 8-phase traffic signal. Typical cycle lengths are 120 seconds during the AM peak period, and 140 seconds during the PM peak period. Signal timings were provided by staff from the Traffic Engineering section of the Bernalillo County Public Works Department.

All approaches to the intersection have protected/permissive left turn phases and each direction of traffic is separated by raised medians near the intersection. The lane configurations are as follows:

NB Prince Street: 1 left turn lane; 1 shared thru/right turn lane
SB Prince Street: 1 left turn lane; 1 shared thru/right turn lane
EB Rio Bravo Blvd: 1 left turn lane; 2 thru lanes; 1 right turn lane
WB Rio Bravo Blvd: 1 left turn lane; 2 thru lanes; 1 right turn lane

Please see Figure III.B.1 showing the lane configurations:

The Rio Bravo Boulevard/Prince Street intersection has no visible obstructions or sight distance issues from all approaches, as shown in the pictures below:

NB Prince St. at Rio Bravo Blvd.

SB Prince St. at Rio Bravo Blvd.

EB Rio Bravo Blvd. at Prince St.

WB Rio Bravo Blvd. at Prince St.

III.B.2.3 SECOND STREET AT RIO BRAVO BOULEVARD

The Second Street/Rio Bravo Boulevard intersection is controlled by an 8-phase traffic signal with typical AM peak and PM peak cycle lengths of 120 and 140 seconds, respectively. Signal timings were provided by staff from the Traffic Engineering section of the Bernalillo County Public Works Department. Each approach to the intersection has protected/permissive left-turn phases. The Railrunner tracks are located approximately 50 feet east of the intersection and run parallel to Second Street. There are railroad crossing devices in place; crossing gates are activated whenever the train comes through. The lane configurations for this intersection are listed below and illustrated on Figure III.B.2:

- NB Second Street: 1 left turn lane; 1 shared thru/right turn lane
- SB Second Street: 1 left turn lane; 1 shared thru/right turn lane
- EB Rio Bravo Blvd: 1 left turn lane; 2 thru lanes; 1 right turn lane
- WB Rio Bravo Blvd: 1 left turn lane; 2 thru lanes; 1 right turn lane

IV. TRAFFIC ANALYSIS

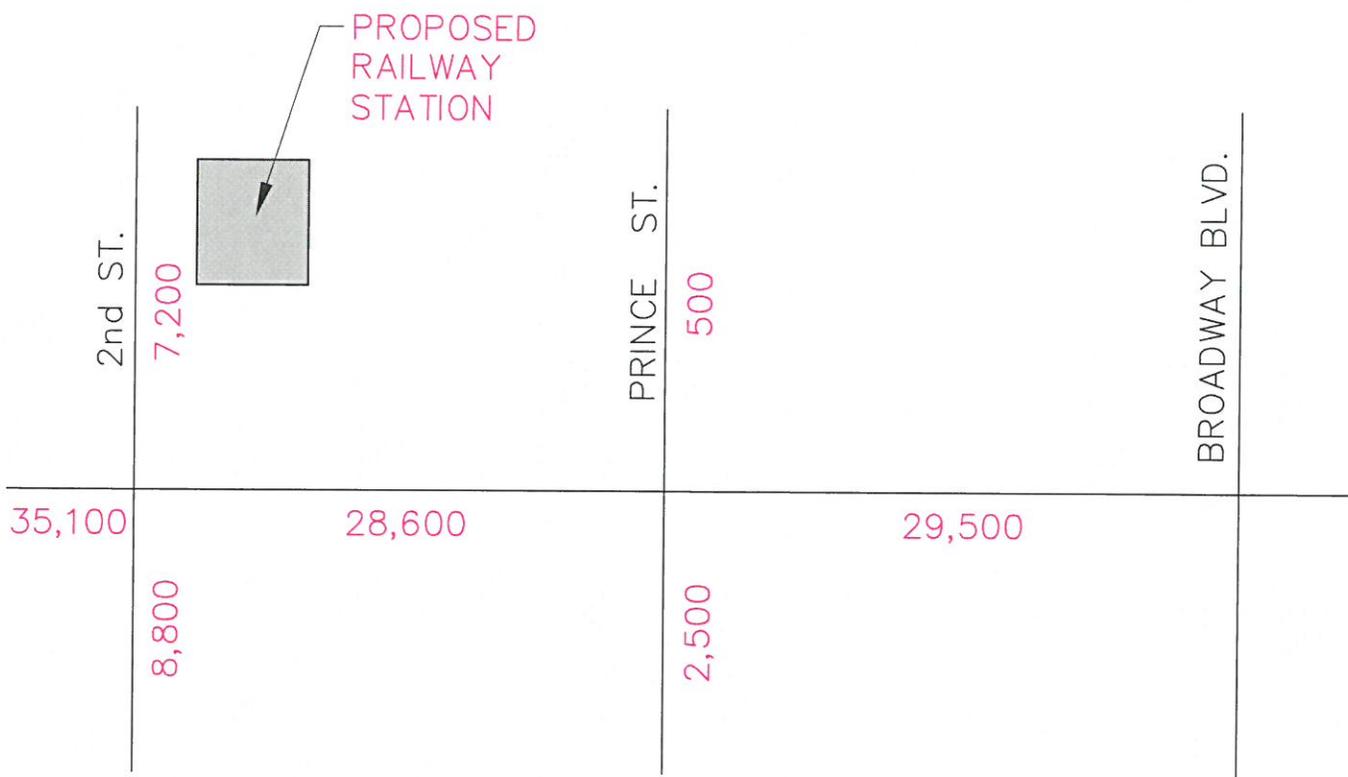

The primary purpose of performing a traffic analysis is to determine the operating characteristics of an identified transportation facility for existing and future conditions and to identify any deficient results. If any deficient results exist, recommendations to geometrics and/or traffic control devices of that facility can be made to improve the performance of it. The two primary elements of a transportation facility that are analyzed are the highway segments and the intersections.

IV.A TRAFFIC DATA

Prior to analyzing any facility, traffic data in the form of traffic volume counts must be obtained. Typically there are two forms of data collected: Average Daily Traffic (ADT) in vehicles per day (VPD) and 9-hour or 12-hour volume counts in vehicles per hour (VPH). ADT counts are usually counted for a period of 48-hours during weekdays along roadway segments using tube counters or other approved electronic counting devices. The 48-hour counts are then averaged to obtain a 24-hour count. The ADT data collection criteria must comply with the NMDOT Data Collection Bureau's Traffic Monitoring Standards and FHWA requirements.

9-Hour or 12-Hour manual counts are usually performed at intersections during the highest used weekday hourly intervals to obtain the vehicle movements for each lane at each approach. The highest hourly intervals refer to the heaviest utilized time periods for a given intersection and are measured in vehicles per hour (VPH). These are more typically known as the peak hours and normally, but not always, occur during the 7:00 – 9:00 am hours; 11:00 am – 1:00 pm hours and 4:00 pm – 6:00 pm hours of a given weekday. For this analysis, the AM peak period was from 6:45 to 7:45 a.m., and the PM peak period was from 4:30 to 5:30 p.m. The turning movement counts were obtained from MRCOG and are included in Appendix A.

Figure IV.A.1 shows the existing ADT locations, and Figures IV.A.2 and IV.A.3 show the existing intersection turn movement volumes in the AM and PM peak hours for the intersections of Rio Bravo Boulevard at Prince Street and Second Street.

IV.B TRAFFIC OPERATIONAL ANALYSIS

As traffic volumes along roadway segments continue to increase over time, the flow rate of the vehicles tends to also increase causing the mean speed of passenger cars to decrease. This ultimately causes delay and congestion along highways. Intersections, signalized and un-signalized, are analyzed to determine the approach delay and capacity for existing and future conditions. The future conditions scenarios take into account the projected peak hour volumes utilizing existing, as well as, proposed roadway or intersection improvements.

IV.B.1 OPERATIONAL ANALYSIS DEFINITIONS

The operational performance of an intersection or a highway facility is based on Level of Service (LOS) criteria. LOS is a term used to qualitatively describe roadway and intersection traffic operations. LOS is expressed in letter grade format from A to F, with LOS A representing the best operating conditions and LOS F representing the worst. Per the NMDOT *State Access Management Manual*, LOS C for rural conditions and LOS D for urban conditions are acceptable measures. In either case, a LOS F shall not be accepted for any individual movements. General description of level of service is as follows:

- LOS A:** Travel time is as efficient as the roadway or intersection facility can provide. Individual users virtually travel unaffected by the presence of others in the traffic stream.
- LOS B:** Travel time remains efficient. Motorists have a high degree of freedom to select speed and operating conditions, but are slightly influenced by other road users.
- LOS C:** The efficiency of travel is reduced, but delays are well within reasonable limits. Traffic flow is becoming more restricted as individual users interact substantially with other road users.
- LOS D:** Travel time continues to increase, and motorist delay approaches but still within reasonable limits. Motorists are able to travel at designated speeds for the facility, but freedom to maneuver in the traffic stream is restricted.
- LOS E:** Travel time is substantially affected. Delays have reached and may exceed reasonable limits. The capacity of the facility is fully utilized.
- LOS F:** Travel along the roadway or through an intersection is very inefficient. Traffic flow is forced in that the amount of traffic approaching a point exceeds the amount that can be served. The roadway facility fails.

IV.B.2 ACCESS CONTROL DEFINITIONS

Per the NMDOT *State Access Management Manual*, two types of access control for arterial roadways are described below:

Full Control of Access – That part of access control where preference is given to through traffic by providing access connections only with selected public roads, and by prohibiting at-grade crossing and direct driveway connections.

Partial Control of Access – That part of access control where preference is given to through traffic to a degree that some at grade crossing may be permitted.

Rio Bravo Boulevard within the study area has existing median breaks and driveway access points; therefore, it is considered a limited (partial) access facility.

IV.B.3 LOS CRITERIA FOR SIGNALIZED INTERSECTIONS

LOS CRITERIA FOR SIGNALIZED INTERSECTIONS

LOS	Delay per Vehicle (sec/veh)
A	Less than or equal to 10
B	>10 – 20
C	>20 – 35
D	>35 – 55
E	>55 – 80
F	>80

TABLE IV.B.1

sec/veh = seconds of delay per vehicle

IV.B.4 STUDY METHODOLOGY

In order to efficiently analyze the volumes of operation elements previously described, the use of various traffic analysis computer software packages is required. These software programs are all developed using the *Highway Capacity Manual 2000* accepted concepts.

The *Highway Capacity Software* (HCS) by McTrans is used to analyze freeway, multi-lane and two-lane segments, freeway ramp merge/diverge areas, lane weaving, and unsignalized intersections.

Synchro/Simtraffic is utilized for signalized intersections and corridor progression and simulation analysis.

IV.C EXISTING CONDITIONS ANALYSIS

IV.C.1 ROADWAY OPERATIONS

The 2007 current AM and PM peak hour conditions for the Rio Bravo Boulevard between Prince and Second Streets were analyzed for this study. The results of the capacity analyses are summarized in Table III.C.1 and Table III.C.2. All HCS arterial segment capacity analysis runs have been provided in Appendix B – Existing Capacity Analysis.

Rio Bravo Corridor Segment Existing Condition (2006) Second Street to Prince Street	EB LOS		WB LOS	
	AM	PM	AM	PM
Existing Corridor LOS	C	A	B	C

TABLE IV.C.1

IV.C.2 SIGNALIZED INTERSECTION OPERATIONS

A signalized intersection operational analysis for the existing conditions was completed for the two signalized intersections on Rio Bravo Boulevard closest to the railway station. The operational analyses were completed for the current 2007 AM & PM Peak Hours of a typical weekday for the facility. The following Table IV.C.2 summarizes the existing traffic operations for the intersections. The Synchro analyses runs for the existing conditions for the AM and PM Peak Hours can be found in Appendix B – Existing Capacity Analysis.

**SIGNALIZED INTERSECTION OPERATIONS ANALYSIS SUMMARY –
2007 PEAK HOURS – EXISTING CONDITIONS**

INTERSECTION	PEAK PERIOD	LEVEL OF SERVICE & DELAY BY APPROACH MOVEMENT												INTERSECT.	
		EB			WB			NB			SB			DELAY (sec/veh)	LOS
		L	T	R	L	T	R	L	T	R	L	T	R		
Rio Bravo Boulevard At Prince Street	AM	A	D	A	B	A	A	D	B	B	D	B	B	39.4	D
	PM	A	B	A	C	B	A	C	A	A	C	B	B	16.3	B
Rio Bravo Boulevard at Second Street	AM	F	C	A	B	D	B	C	C	C	C	C	C	36.2	D
	PM	E	C	A	B	F	B	F	C	C	C	F	F	80+	F

TABLE IV.C.2

As shown on Table IV.C.2, the intersection of Second Street at Rio Bravo Boulevard has existing operational issues during the PM peak period. During that time, there are very high volumes at certain movements at this intersection that conflict with opposing movements. Those movements are:

- eastbound left turn/westbound through movements on Rio Bravo Boulevard
- northbound left turns/southbound through movements on Second Street

The delays from these movements results in unacceptable levels of service for those approaches, as well as for the overall intersection itself. Those movements will not be affected by the traffic volumes that will result from the railway station.

The intersection of Prince Boulevard at Rio Bravo Boulevard currently has acceptable levels of service for all movements during the AM and PM peak times. Because Prince Street has the primary station access, located approximately 300 feet north of its intersection with Rio Bravo Boulevard, this intersection will be most affected by the opening of the railway station.

IV.D PROPOSED CONDITIONS ANALYSIS WITH RAILWAY STATION

IV.D.1 TRIP GENERATION AND DISTRIBUTION

Trip generation characteristics for the proposed railway station (with and without the right turn in only lane from westbound Rio Bravo Boulevard) were estimated using the established trip rate contained in the 7th Edition of the ITE Trip Generation Manual (2003).

For this analysis, it is assumed that the parking lot (172 total parking spaces) will have an occupancy rate of 75% (129 trips). All trips generated are assumed to be primary trips. Primary trips are defined as trips generated by a proposed development that are added to the adjacent street system as new trips. It is also assumed that the number of drop-offs and pick-ups will equal 50% of the trips generated by the parking spaces (65 trips). The 194 trips are then multiplied by 3.91 space rate for a total of 758 daily trips in and out of the facility.

Table IV.D.1 summarizes the trip generation characteristics for the railway station:

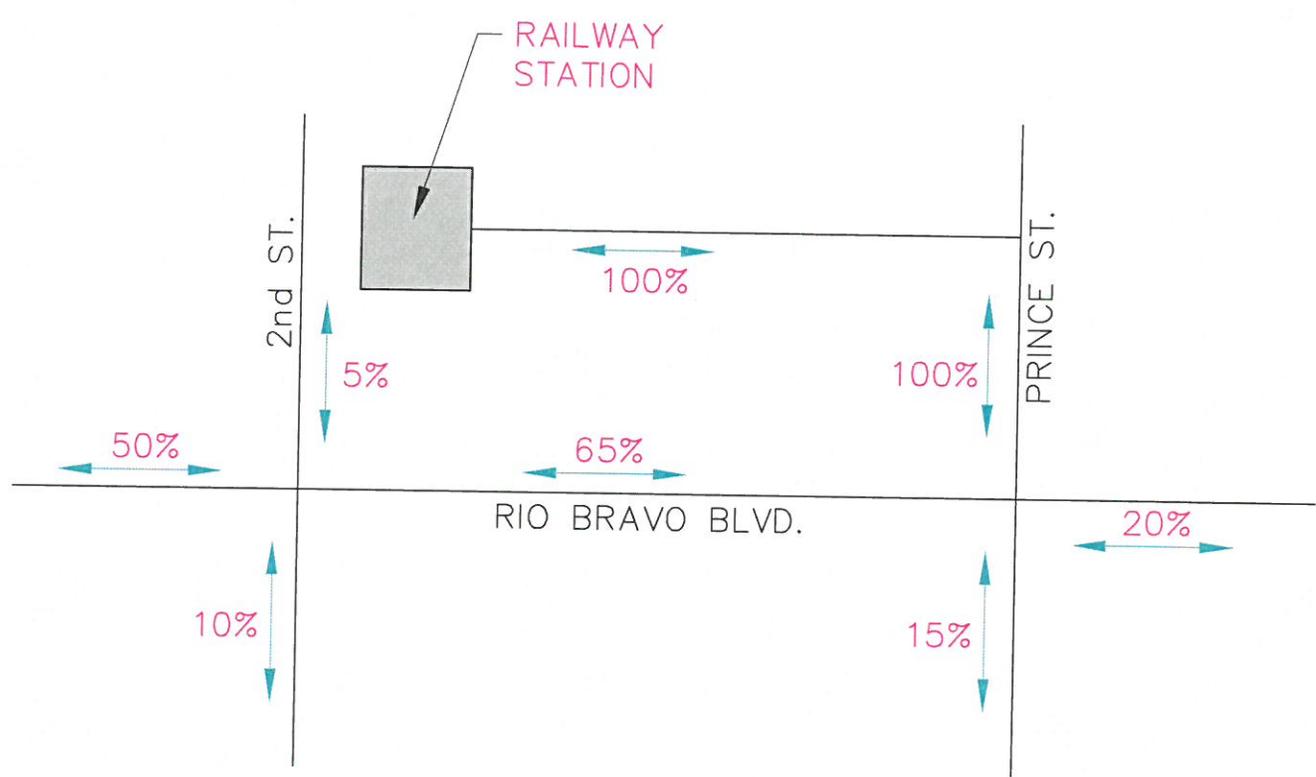

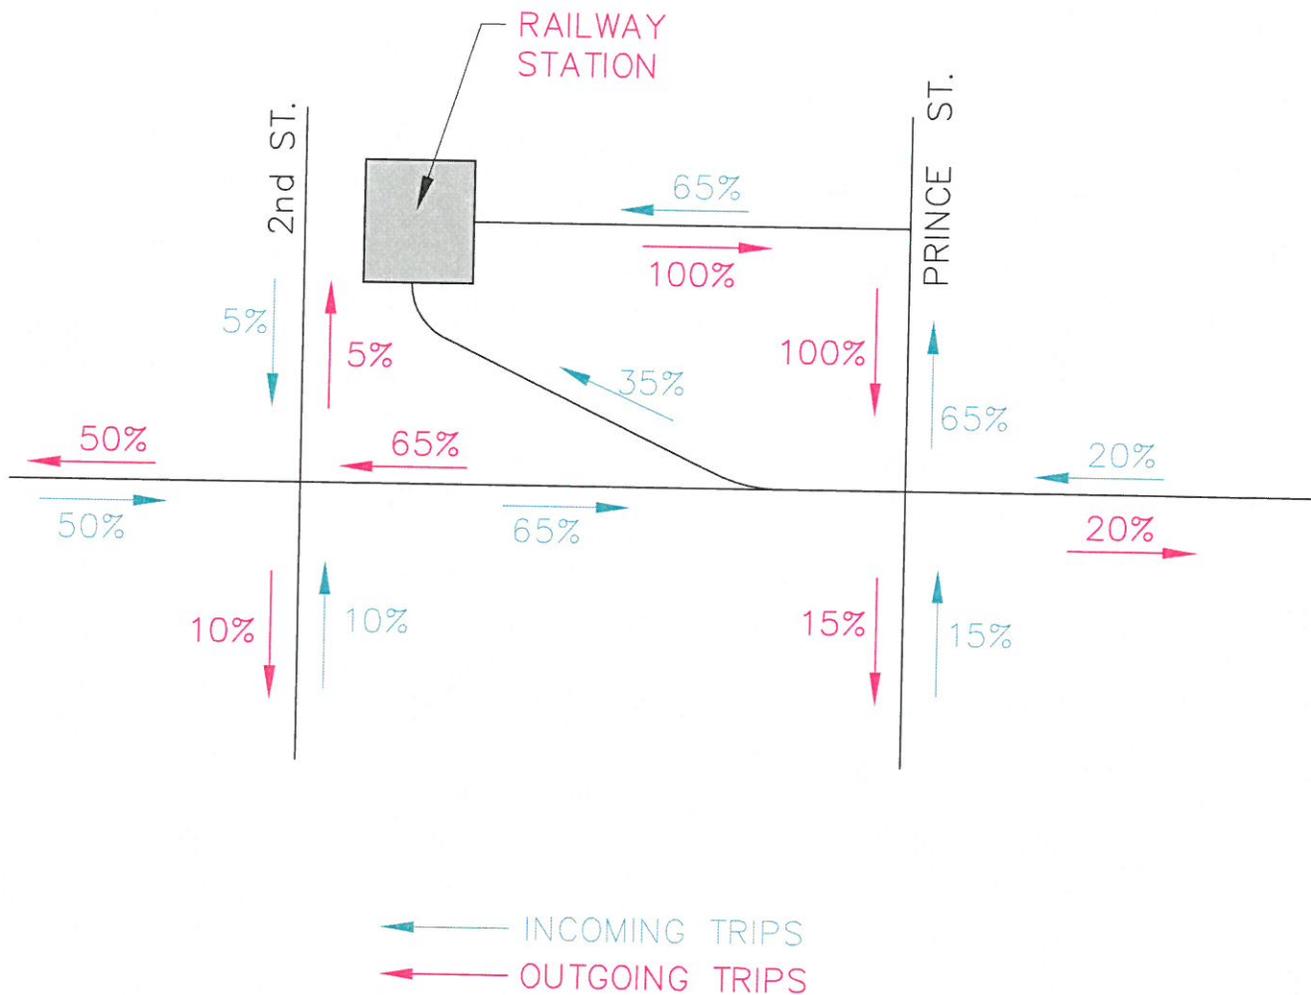

TRIP GENERATION – RIO BRAVO/AIRPORT RAILWAY STATION						
Independent Variable	Daily Trips		AM Peak Trips (9% of Daily Trips)		PM Peak Trips (10% of Daily Trips)	
	Total Trips	Ent./Ext %	Total Trips	Ent./Ext %	Total Trips	Ent./Ext %
75% Occupancy (129 Trips with 3.91/Occupied Space Rate and including 50% for drop-off/pick-ups)	758	50/50	68	80/20	76	58/42
TOTALS	758	50/50	68	80/20	76	58/42

TABLE IV.D.1

Trip distribution assumptions are based on engineering judgment considering the socio-economic characteristics of adjacent land uses in the area of town near the proposed railway station, as well as the Bernalillo County region.

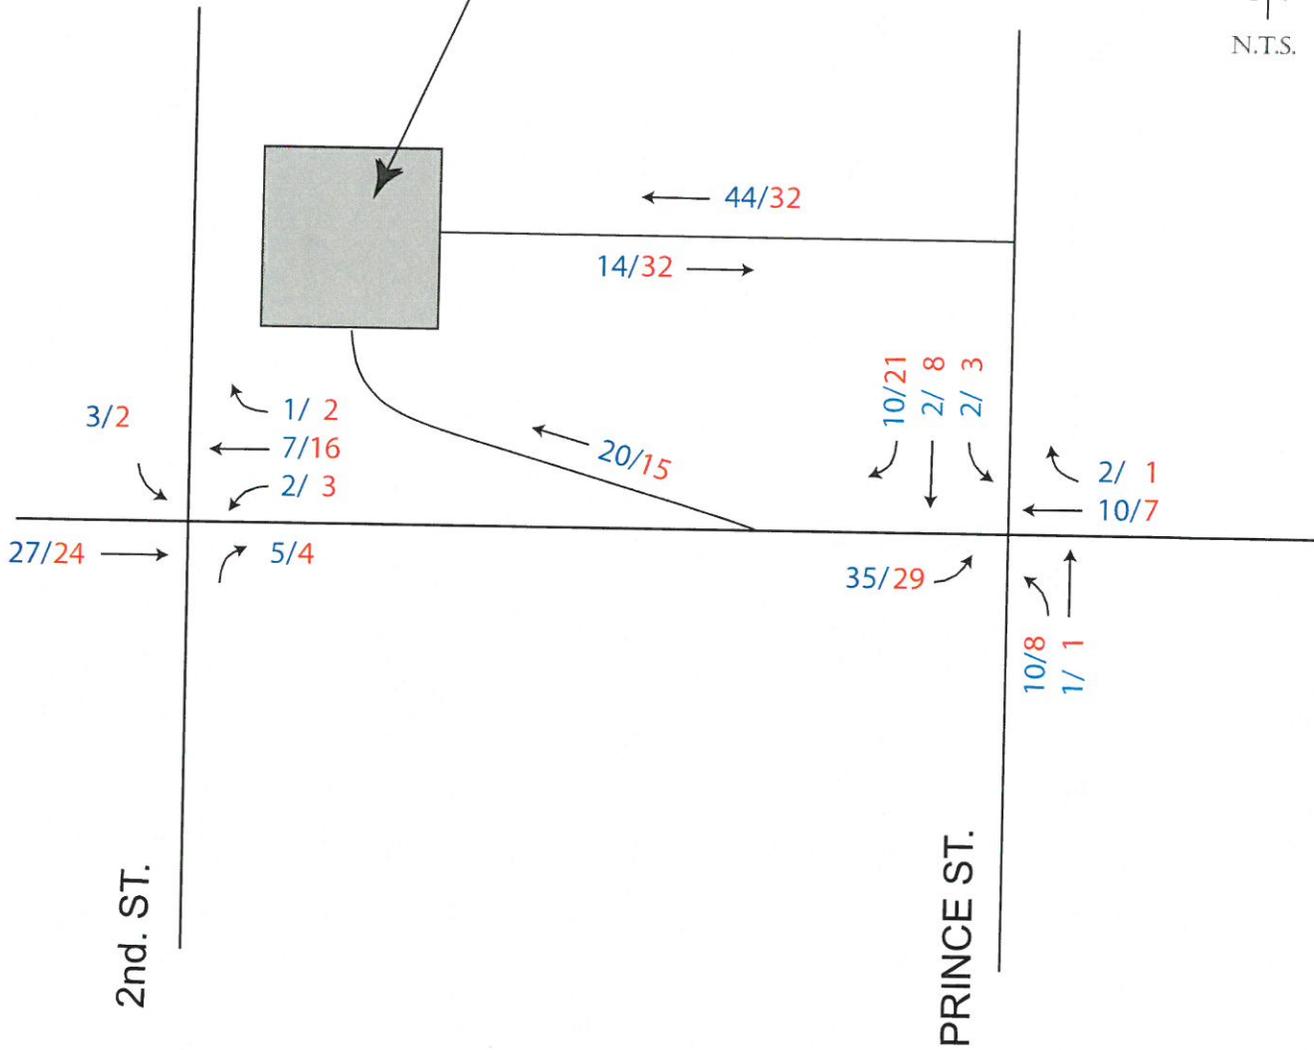

Trip distributions for each scenario (with and without the right-turn-in only access from Rio Bravo Boulevard) to the station have been evaluated. The trip distributions for each scenario are shown on Figures IV.D.1 and IV.D.2:

RAILWAY
STATION

HDR Engineering, Inc.

COMMUTER RAIL STATION
TRAFFIC IMPACT STUDY

FIGURE IV.D.3 - PEAK HOUR VEHICLE
DISTRIBUTION WITH RIO BRAVO ACCESS

FILENAME
SCALE

SHEET
25

IV.D.2 LOS COMPARISON

Synchro and HCS analyses were completed in order to compare LOS for each of the three scenarios on Rio Bravo Boulevard - Existing Conditions, No Access to Station from Rio Bravo Boulevard, and Access to Station from Rio Bravo Boulevard (the detailed capacity analysis reports can be found in Appendix C – Capacity Analysis With and Without Rio Bravo Access). Table IV.D.2 summarizes the corridor LOS for each of the three scenarios:

Rio Bravo Corridor Segment LOS Second Street to Prince Street		EB LOS		WB LOS	
		AM	PM	AM	PM
	Existing Conditions	C	A	B	C
	Without Access from Rio Bravo Blvd.	C	A	B	C
	With Access from Rio Bravo Blvd.	C	A	B	C

TABLE IV.D.2

As shown on Table IV.D.3, the LOS does not change for the signalized intersections as a result of the railway station:

Rio Bravo Intersection LOS	Rio Bravo at Prince St.		Rio Bravo at Second St.	
	AM LOS	PM LOS	AM LOS	PM LOS
Existing Conditions	C	B	C	F
Without Access from Rio Bravo Blvd.	C	B	C	F
With Access from Rio Bravo Blvd.	C	B	C	F

TABLE IV.D.3

Intersection delay at each intersection shows no significant changes that result from the proposed railway station, as shown in Table IV.D.4:

Rio Bravo Corridor Intersection Delay (in seconds)	Rio Bravo at Prince St.		Rio Bravo at Second St.	
	AM	PM	AM	PM
Existing Conditions	25.4	26.1	34.4	80+
Without Access from Rio Bravo Blvd.	25.1	27.5	35.1	80+
With Access from Rio Bravo Blvd.	25.1	27.6	36.1	80+

TABLE IV.D.4

IV.E ACCESS MANAGEMENT CRITERIA FOR DRIVEWAY ACCESS

Chapter 8 of the NMDOT *Access Management Manual* contains criteria for driveway access points. For partial (right turn/deceleration lane) access to an urban principal arterial with a posted speed limit of 45 mph; the required spacing per Table 18.C-1 is 450 feet.

The proposed location of the right turn/deceleration lane meets these criteria, since there are no existing driveways on the north side of Rio Bravo Boulevard between Second Street and Prince Street and would also be over 450 feet away from the signalized intersections at Second Street and Prince Street.

IV.F RIGHT TURN/DECELERATION LANE FROM RIO BRAVO BOULEVARD TO RAILWAY STATION

The assigned number of trips that would utilize the proposed right turn/deceleration lane in each peak hour is shown in Table IV.F.1:

ASSIGNED TRIPS TO RAILWAY STATION					
AM PEAK			PM PEAK		
Total AM Peak Trips	Entering/Exiting Trip %	Entering Trips Using Right Turn Lane (35%)	Total PM Peak Trips	Entering/Exiting Trip %	Entering Trips Using Right Turn Lane (35%)
68	80/20	20	76	58/42	15

TABLE IV.F.1

Table 17.B-2 of the NMDOT *Access Management Manual* has criteria for installation of right turn/deceleration lanes from urban multi-lane highways. The *Access Management Manual* criteria calls for minimum volumes in the through lane adjacent to the proposed right turn/deceleration lane. The required minimum volumes are summarized below in Table IV.F.2:

MINIMUM REQUIRED VOLUMES					
AM PEAK			PM PEAK		
Entering Trips Using Proposed Right Turn Lane	Minimum Volume Required in Adjacent Through Lane per Access Mgmt. Manual	Existing Volumes on WB Rio Bravo Blvd. in Adjacent Through Lane	Entering Trips Using Proposed Right Turn Lane	Minimum Volume Required in Adjacent Through Lane per Access Mgmt. Manual	Existing Volumes on WB Rio Bravo Blvd. in Adjacent Through Lane
20	180	390	15	240	840

TABLE IV.F.2

As shown on Table IV.F.2, the minimum volumes for adjacent lanes are met based on the number of assigned trips that would use the proposed right-turn/deceleration lane.

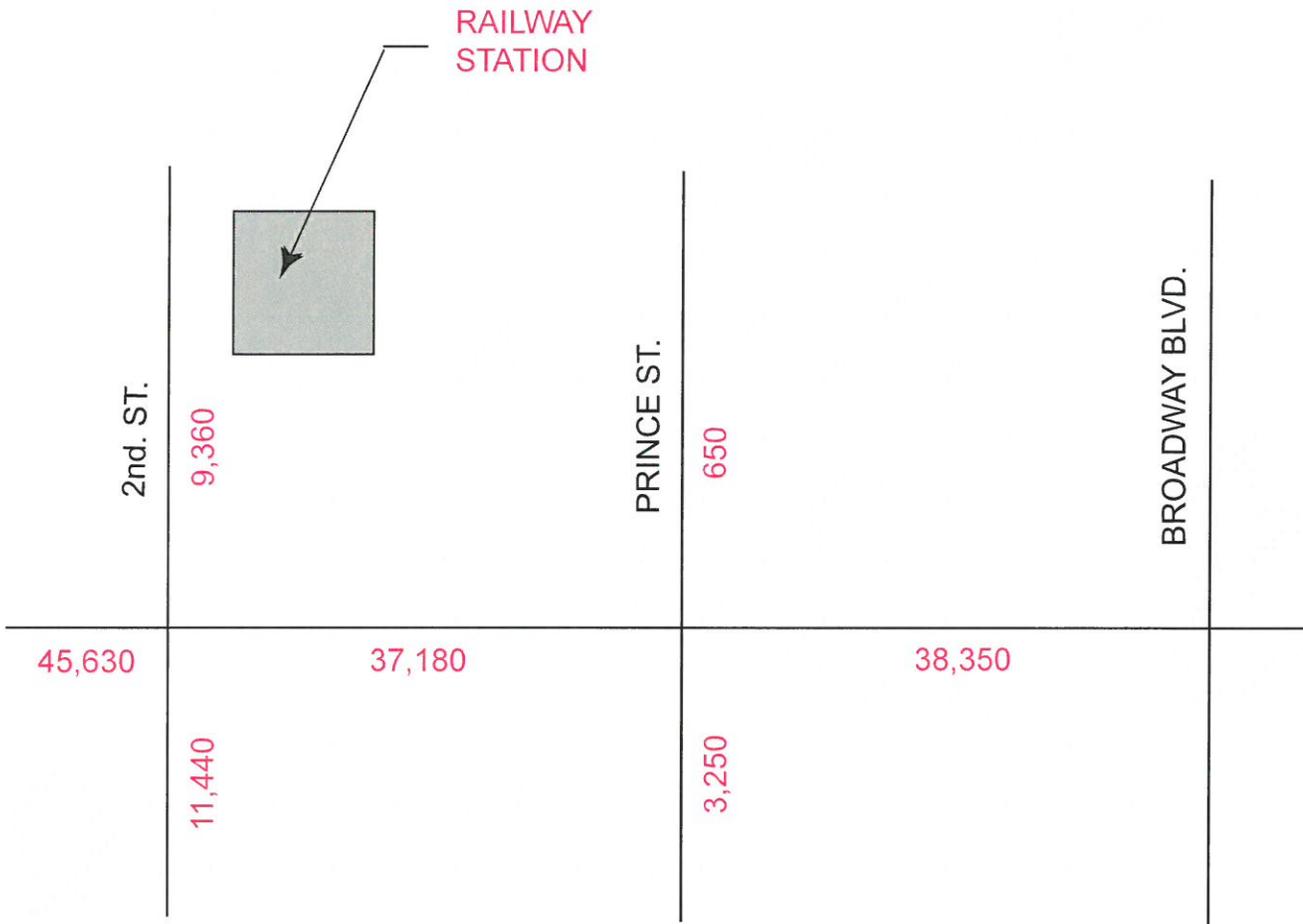

V: TEN-YEAR (2017) GROWTH PROJECTIONS

The Mid-Region Council of Governments of New Mexico (MRCOG) has provided traffic volume projections for use in this study. The projections are from the regional travel demand model, which generates anticipated travel demand based on assumptions of anticipated growth in socioeconomic data and programmed network assumptions for the 20-year period from 2005 to 2025. As suggested by MRCOG, the projections were then adjusted for the 2017 timeframe (60% of the 20-year projections, since 2017 is 12 years away from the origin date of 2005). The growth percentages are shown in Table V.1:

RIO BRAVO BOULEVARD – GROWTH PROJECTIONS						
Rio Bravo Boulevard	Anticipated 20-Year (2025) Growth Percentages			Adjusted 2017 Growth Percentages		
	AM Peak	PM Peak	Daily	AM Peak	PM Peak	Daily
Eastbound	61%	46%	52%	36.6%	27.6%	31.2%
Westbound	49%	61%	48%	29.4%	36.6%	28.8%

TABLE V.1

Figure V.1 shows the projected ADT's along the Rio Bravo Boulevard corridor for the year 2017 based on the adjusted 2017 growth percentages. Figures V.2 and V.3 show turn movement volumes for the Second Street/Rio Bravo Boulevard and Prince Street at Rio Bravo Boulevard intersections:

The 2017 horizon year LOS for the Rio Bravo corridor was calculated, as shown in Table V.2. The detailed capacity analysis reports are included in Appendix D – Ten-Year 2017 Capacity Analysis. Also included in Table V.2 is the existing conditions (2007) LOS for comparison purposes:

RIO BRAVO BOULEVARD – LOS COMPARISON				
Rio Bravo Corridor Segment LOS For Ten-Year Horizon Year (2017) Second Street to Prince Street	EB LOS		WB LOS	
	AM	PM	AM	PM
Existing Conditions (2007) LOS	C	A	B	C
Horizon Year (2017) LOS	D	C	B	D

TABLE V.2

V.I TEN-YEAR (2017) LOS WITH AND WITHOUT RIO BRAVO BOULEVARD ACCESS TO RAILWAY STATION

The 2017 horizon year LOS for the signalized intersections of Rio Bravo Boulevard at Second Street and Prince Street was calculated, with the results being shown on Table V.I.1. Analysis was completed for each scenario (with and without) of the proposed access from Rio Bravo Boulevard, using the assigned trip generation and distribution percentages as previously shown on Figures IV.D.1 and IV.D.2: The detailed capacity analysis reports are included in Appendix D - Ten-Year 2017 Capacity Analysis.

SIGNALIZED INTERSECTION LOS COMPARISON									
Rio Bravo Boulevard Signalized Intersection LOS With and Without Access From Rio Bravo Boulevard	Existing Conditions (2006)				Horizon Year (2017) Conditions				
	Rio Bravo at Prince St.		Rio Bravo at Second St.		Rio Bravo at Prince St.		Rio Bravo at Second St.		
	AM LOS	PM LOS	AM LOS	PM LOS	AM LOS	PM LOS	AM LOS	PM LOS	
WITH Access from Rio Bravo Blvd.	C	B	C	F	F	C	F	F	
WITHOUT Access from Rio Bravo Blvd.	C	B	C	F	F	C	F	F	

TABLE V.I.1

As with the Rio Bravo Boulevard corridor, the anticipated volume increase over the ten-year period results in significant decreases to the LOS of the two signalized intersections on Rio Bravo Boulevard nearest to the future railway station. The decreased LOS at the signalized intersections along the anticipated increases in corridor traffic underscore the need for the additional access to the railway station from Rio Bravo Boulevard.

VI: CRASH ANALYSIS

VI.A: CRASH ANALYSIS REQUIREMENTS AND DESCRIPTION

The purpose of collecting and analyzing historic traffic crash data for a project during consecutive periods is to identify possible crash patterns and to determine the probable causes of those crashes. The crash analysis includes patterns related to roadway conditions; time of day; weather conditions; type of crash; locations, i.e.: roadway, intersection, etc.; crash severity and driver characteristics.

Utilizing crash data also assists with determining expected values of a specific type of crash and ultimately identifying benefit costs and estimated Rate of Return (ROR) for improving roadway segments or intersection locations with the study boundary. These "estimated" ROR values should not be construed as "True" values, but more as approximated for planning purposes.

VI.B CRASH DATA

Crash data for 2003, 2004 and 2005 was requested for this segment of Rio Bravo Boulevard from the NMDOT Traffic Safety Bureau. The crash reports can be found in Appendix E – Crash Analysis.

VI.C CRASH ANALYSIS AND RATE OF RETURN (ROR)

In order to create a comparison between crashes from one location to the other, crash rates are used. These rates are based on data such as traffic volume, length of road sections considered and period of time in years. Typical crash rate equations for intersections are rates per million of entering vehicles (RMEV) and for roadway segments are rates per 100 million vehicle miles (RMVM), as shown below:

$$RMEV = \frac{C \times 1,000,000}{n \times 365 \times v}$$

$$RMVM = \frac{C \times 100,000,000}{n \times 365 \times l \times v}$$

where:

- R = Roadway Crash Rate per million entering vehicles (mev)
- C = Total Crashes in an n-year period
- n = year period of study (minimum 3 years)
- v = total entering volume in vehicles per day

Where:

- R = Roadway Crash Rate per 100,000,000 veh-mi
- C = Total Crashes in an n-year period
- n = year period of study (minimum 3 years)
- l = length of roadway in miles
- v = Average Daily Traffic (ADT) in vehicles per day

The New Mexico Department of Transportation (NMDOT) crash information presented yearly is based on a modified formula of the crash rate/100-million vehicle miles. Their reports show a crash rate (CR) = total crashes/100 MVM. It could be assumed that the state crash rate calculation is a derivation of a methodology typically used by the medical profession, where infection and mortality rates for various diseases are expressed in relation to population. This assumption can be made due to the inclusion of licensed drivers and population data in the crash summary report. Since the state crash rate is significantly higher than typical crash rate calculations, it can be concluded that comparing the state, county or city crash rates to the crash rates developed within this analysis will result in inconsistent comparisons due to the discriminating factors. Also noted, is that state crash rates are only calculated for roadway crashes (RMVM) not intersection crashes. An intersection crash may be included in a roadway crash, but are not provided in a separate calculation (RMEV). This analysis also includes a Critical Rate calculation for segment locations (C_{RI}). The critical rate analysis helps to identify locations or spots with observed crash rates higher than would be expected due to normal variation. The critical rate is calculated as follows:

$$C_{RI} = R_{AR} + k \times \text{sq rt}(R_{AI}/m) + 1/(2 \times m)$$

where:

- R_{AR} = Average Roadway Crash Rate
- k = statistical confidence level (typically 1.645 for $\alpha = 0.05$)
- m = travel on a particular section in million vehicle miles

If R_{AR} is greater than C_{RI} , the location should be investigated further for problems associated with geometric or environmental factors.

Crash statistics have been obtained from the NDMOT for Rio Bravo Boulevard. Table VI.C.1 shows the three-year crash history (2003 to 2005) at the two signalized intersections evaluated in this analysis::

THREE-YEAR (2003 - 2005) CRASH HISTORY AT SIGNALIZED INTERSECTIONS										
RIO BRAVO BLVD. INTERSECTION WITH	2003			2004			2005			3-YR TOTAL ACC.
	INJ	PDO	TOT	INJ	PDO	TOT	INJ	PDO	TOT	
Prince Street	1	1	2	1	7	8	1	4	5	15
Second Street	3	3	6	2	5	7	2	10	12	25
TOTALS	4	4	8	3	12	15	3	14	17	40

TABLE VI.C.1

Table VI.C.2 shows the crash rates for the two signalized intersections:

CRASH RATES FOR SIGNALIZED INTERSECTIONS			
INTERSECTION WITH RIO BRAVO BLVD.	ENTERING ADT FOR INTERSECTION	3-YEAR TOTAL CRASHES	CRASH RATE PER MILLION MILES
Prince Street	32,050	15	0.427
Second Street	39,900	25	0.572

TABLE VI.C.2

In order to evaluate mid-block crashes along the Rio Bravo corridor in this area, crash records were reviewed between Broadway Boulevard and Second Street. Table VI.C.3 shows the crash rates for Rio Bravo Boulevard within this segment:

THREE-YEAR (2003 – 2005) CRASH HISTORY – RIO BRAVO BLVD. BETWEEN BROADWAY BLVD. AND SECOND ST.										
RIO BRAVO BLVD.	2003			2004			2005			3-YR TOTAL ACC.
ROADWAY SEGMENT	INJ	PDO	TOT	INJ	PDO	TOT	INJ	PDO	TOT	
Broadway Blvd to Prince St.	1	1	2	0	2	2	1	1	2	6
Prince St. to Second St.	0	1	1	1	1	2	1	1	2	5

TABLE VI.C.3

Crash rates for mid-block areas are shown below in Table VI.C.4:

CRASH RATES FOR RIO BRAVO BLVD. FROM BROADWAY BLVD. TO SECOND ST.

Roadway Segment	Begin Intersection	End Intersection	Segment Length (Miles)	Number of Reported Crashes	Daily Entering Vehicles (VPD)	Crash Rate (Cr/100-MVM)
1	Broadway Blvd.	Prince St.	0.369	6	29,500	50.3
2	Prince St.	Second St.	0.327	5	28,600	48.8

TABLE VI.C.4

The statewide crash rate for New Mexico is 148.0 accidents per 100 million vehicles miles. As shown in Table VI.C.4, the crash rates for this midblock segment of Rio Bravo Boulevard are much lower with the statewide crash rate for midblock segments.

The proposed westbound right-in access/deceleration lane for railway station is not expected to lead to an increased crash rate along the Rio Bravo Boulevard corridor.

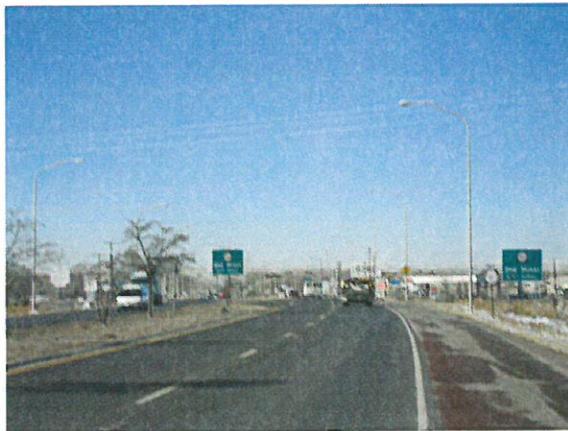

VII. PROPOSED CORRIDOR IMPROVEMENTS

In order to provide optimum access to the Rio Bravo/Airport railway station, it is recommended that the following improvements take place:

- 1) A right-turn/deceleration lane from westbound Rio Bravo Boulevard into the railway station site. This lane is justified by anticipated volumes into the commuter rail site, and does not violate the established spacing requirements in Chapter 8 of the NMDOT *Access Management Manual*. Table 18.K-1 of the manual shows deceleration lane tapers and lane lengths, based on posted speed of the mainline street and a lane width of 12 feet. Rio Bravo Boulevard has a posted speed limit of 45 mph; therefore, the recommended distances for the taper and deceleration lane per Table 18.K-1 are:

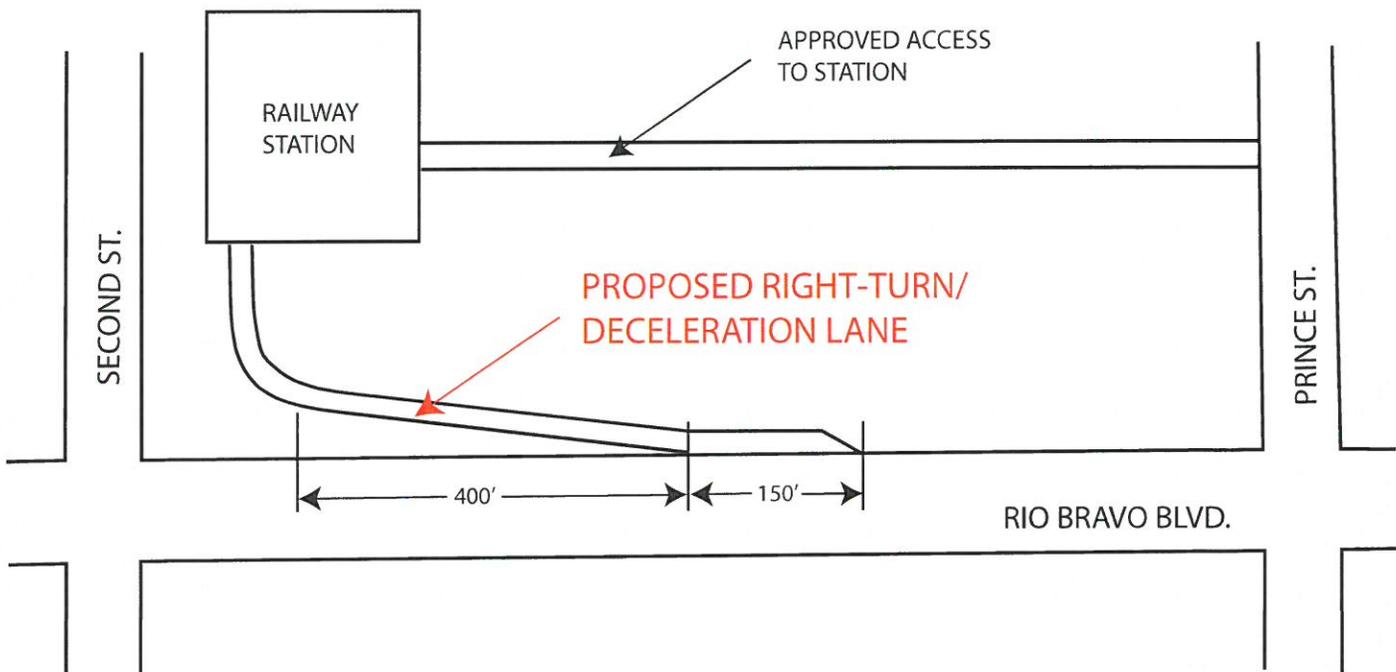

Deceleration taper length: 150 feet
 Deceleration lane length: 400 feet

Shown below is a picture of westbound Rio Bravo Boulevard in the approximate area where the proposed right turn/deceleration lane will be installed:

Westbound Rio Bravo Boulevard
east of Second Street

The proposed right turn/deceleration lane is illustrated on Figure VII.1:

HDR Engineering, Inc.

COMMUTER RAIL STATION TRAFFIC IMPACT STUDY

FIGURE VII.1 - PROPOSED RIGHT TURN AND
DECELERATION LANE FROM RIO BRAVO BLVD.

FILENAME

SHEET

SCALE

39

- 2) Lengthening of the left turn pocket for eastbound Rio Bravo Boulevard at Prince Street. In its current configuration, this turn pocket is only approximately 40 feet in length. This distance is not adequate for the current low left-turn volumes going into Prince Street, and with the primary access to the railway station coming from Prince Street, it will be necessary for this left turn pocket to be lengthened.

The calculation for left turn pocket lengths for left turn lanes with protected/permissive left turn phasing, as listed in the *Toolbox on Intersection Safety and Design* (ITE, September 2004) is as follows:

$$F \times V \times (C/3600) \times (C-g/C) \times l$$

where: F = 1.75
V = volume of left turns in peak hour
C = cycle length
g = green time for left turn phase
l = vehicle length in feet

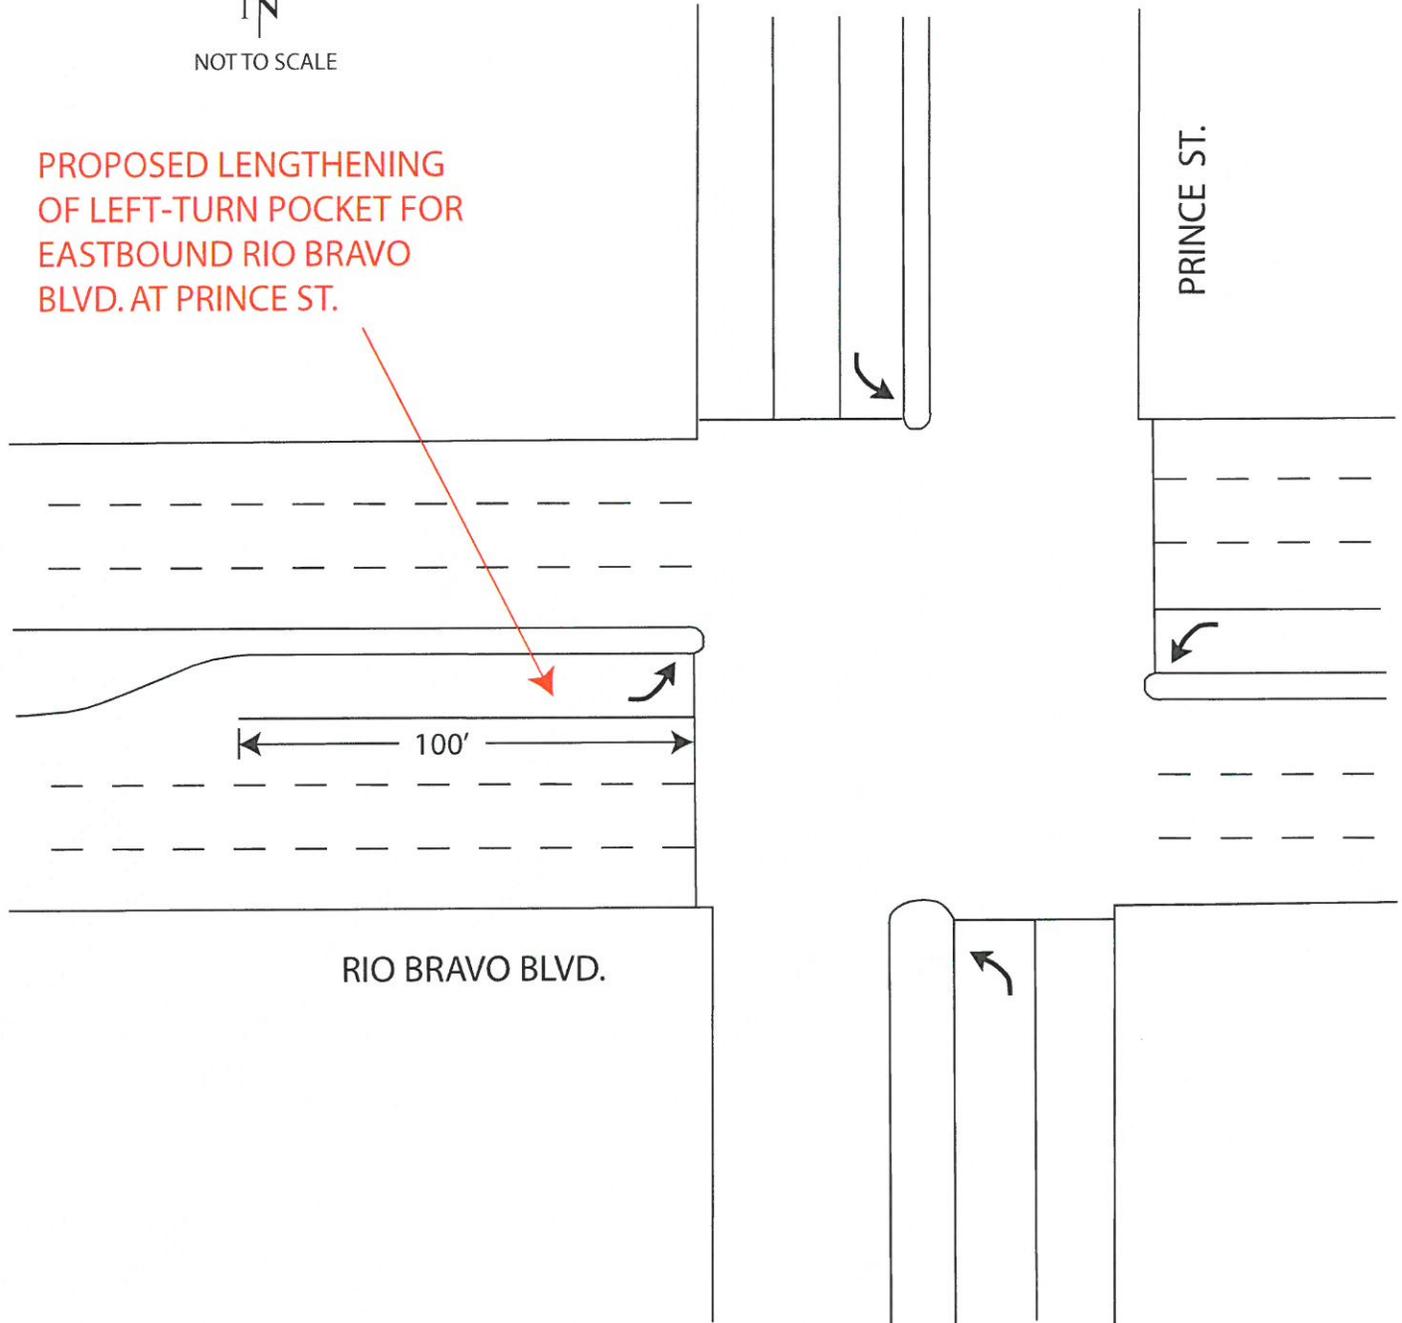

This calculation yields a pocket length of 96.98 feet; therefore based on this calculation, the recommended length for the turn pocket is 100 feet.

The proposed lengthening of the eastbound left turn pocket on Rio Bravo Boulevard at Prince Street is shown on Figure VII.2:

FREE-FLOW SPEED

	Direction	1	2	1	2
Lane width		12.0	ft	12.0	ft
Lateral clearance:					
Right edge		6.0	ft	6.0	ft
Left edge		6.0	ft	6.0	ft
Total lateral clearance		12.0	ft	12.0	ft
Access points per mile		4		4	
Median type		Divided		Divided	
Free-flow speed:		Base		Base	
FFS or BFFS		50.0	mph	50.0	mph
Lane width adjustment, FLW		0.0	mph	0.0	mph
Lateral clearance adjustment, FLC		0.0	mph	0.0	mph
Median type adjustment, FM		0.0	mph	0.0	mph
Access points adjustment, FA		1.0	mph	1.0	mph
Free-flow speed		49.0	mph	49.0	mph

VOLUME

	Direction	1	2	1	2
Volume, V		1900	vph	900	vph
Peak-hour factor, PHF		0.90		0.90	
Peak 15-minute volume, v15		528		250	
Trucks and buses		4	%	4	%
Recreational vehicles		0	%	0	%
Terrain type		Level		Level	
Grade		0.00	%	0.00	%
Segment length		0.00	mi	0.00	mi
Number of lanes		2		2	
Driver population adjustment, fP		1.00		1.00	
Trucks and buses PCE, ET		1.5		1.5	
Recreational vehicles PCE, ER		1.2		1.2	
Heavy vehicle adjustment, fHV		0.980		0.980	
Flow rate, vp		1076	pcphpl	510	pcphpl

RESULTS

	Direction	1		2	
Flow rate, vp		1076	pcphpl	510	pcphpl
Free-flow speed, FFS		49.0	mph	49.0	mph
Avg. passenger-car travel speed, S		49.0	mph	49.0	mph
Level of service, LOS		C		A	
Density, D		22.0	pc/mi/ln	10.4	pc/mi/ln

Overall results are not computed when free-flow speed is less than 45 mph.
